Dependability Always the gauge of the Automobile

Into the furthermost corners of the world magneto ignition has carried the reputation of the Ford for dependability.

557

That is what sells cars, dependability, not price. No matter what a car may cost, it is always judged upon its dependability.

Here is proof of it—here is a man who would rather own the lowest priced car of all, with magneto ignition, than a more expensive car with battery ignition.

As always, magneto ignition supplies the dependability that is lacking in battery ignition.

### The Case for Water Power (Comitmued from page 541)

water power amounts to nothing at all and here the topography is solely response ble the entire settled portion being located in prairie country which possesses; natural water-power sites

Nor is our northern neighbor the oul; one of our contemporaries that has begun to tap the great supply of stored sun-power represented by the water that runs down hill all over the surface of the earth in Great Britain traditional coal-burner proposals have been put forward for vast central station plants, and careful stock United Kingdom Since the outbreak of the war and the divorce of Italy from her previous sources of coal supply, the Italian Government has proceeded with an active water power policy, in 1917 and 1918 con cessions were granted for 1,024,000 horse power Norway has developed 1,120 000 se power, and plans to export current to Denmark Barcelona, in Spain is replacing steam power by hydroelectricity In Switzerland fully a quarter of the two millions of hydro-horse-power available have been developed. All these items are straws showing where the wind blows I hey indicate that other people are laying a better foundation for power for the year to come It is with these peoples that we must compete for the world s trade

# Connecting Staten Island with Manhattan

(Continued fr mt page 545) York (ity An alternative route is shown at B I his calls for a tunnel to I lis at B lating and thence to the Jersey shore, where the tube would rise out of the Bay and the line would be continued by a bridge within the bulkhead line of the Jersey shore to Constable Hook Here a tunnel would the Special Committee on Reorganization of punder the Kill van Auli and ran into the U. S. Employment Service, the Bureau all the advantages of Route A with the All Innugration and the Children's Bureau all the advantages of Route A with the additional advantage of providing for travel out in the open through most of the Both of these plans are proposed by the Staten Island Chamber of Commerce

Route C is a direct tunnel running all the which has been suggested by John I O Rourke

Of course all tunnel schemes are ex pensive particularly when they depend merely upon the traffic provided by Staten Island For this reason Route D has been Island For this reason Route D has been proposed by Gustave Lindenthal, which consists of a tube under the Hudson River to Jursey ( ity and thence a railr Bayonne with a tube under the Kill van Kull at (onstable liook Such a route would provide for taking on passengers at Bavonne and other points and would probably early more traffic than would the direct tunnel route

Route I proposed by S Johannesson is s milar to Route B in that it provides for tunnel connection with Ellis Island and Comrunipaw, but advantage is taken of Ellis island to bring the tube out of water and extend it as a bridge direct to Staten any way afferts any reconstruction pro-trains or policy must be looked upon as all work the value of which cannot be measured in other time or money but whoth which we could individually or officially, proceed at best but slowly and in the dark Created for and functioning expressly to an information is very much at the service tion information is very much at the service of those natividuals, corporations or other interests which need it, either by letter, interests which need it, either by letter, the phoney were or personal microrsew The Research Division is the point of the should be required for large theybone, were or personal microrsew to seel. The by along the Jersey shore contact between both government as a so whole and the functioning of parts of the LEGAL NOTICES

PATERT LINEST OR SHIPPIP NEW SHIPP PALES.

In addition to a direct connection with Manhattan, it is proposed by John F O'Rourke that a vehicle tunnel be run to Bay Ridge, as indicated at E This tunnel being practically two miles in length, would neet with the same objection that was brought form against the Hudson ventilation.

I tunnel, namely the difficulty of ventilation.

A novel suggestion has been proposed to overcome the visitlating problem. Vehicles would not pass through the tube under their own power. Instead there would be described to the control of the con direct lines of railroad through the tube on which trains of flat cars would be run These trams would be electrically propelled and on the flat cars the vehicles would be carried This would provide uniform rapid transit for all classes of vehicles, and there would be no possenous fumes liberated in

We shall not attempt to pass upon the relative merits of these various plans, but it is clearly evident that something must be done and done soon, to connect States. Island more closely with the city

### Better Packages and How to Know Them

(Continued from page 546) the nails The wood may split or break across the grain

Any one of the numerous weaknesse of packing box construction may be de-veloped in this test until finally the of server is able to build up a box that is practically equally strong in every feature Boxes are then built packed, and tested until the presence of this balance in design is clearly demonstrated. Such a demon stration will show failures ultimately or curring in average proportion in naile pulling from the wood, wood pulling from the nails splitting or breaking of ends sides, tops or bottoms and through the

# Accelerated Tests for Overseas Shipping Containers

The special box testing machine the borest Products Laboratory at Made son, Wis have been of considerable service during the war Specifications prepared largely in the U Second Service were adopted by the Central Staff for the entire War Department These specifications allow the use of all species of wood suit able for boxes and crates and require able for boxes and craces and required different thicknesses of material, spacing and size of nails etc. depending on the requirements of use. These general specifications have reduced costs very materially mcressed the sources of supply, and opened the field to package manufacturers generally

About 20 types of boxes have been re-designed for the Ordnance Department of the Army and other bureaus and services the Army and other pureaus and services. The Ordinance Department reports that the Service recommended immense value—the boxes recommended have generally proven cheaper than the original designs owing to the use of a large number of species rather than white pre-aione and the use of standard types of construction and standard thinknesses of

### Saving in Space in Overseas Ships

The boxes recommended have generally been of considerably has displacement than been of considerably less displacement then original designs, and the money value of the shipping space saved has been a viry-large item. As specific xxamples, are specifications for ordnance equipment boxes made possible the use of about '30' species rather than high-grade white pan-done, admitted thinner material, and saved cargo space. These boxes were displiced by the million. Here was a supper by on minion 111678 was a distinct space saving in grenade boxes through redesign and slipments were made by thousands. A redesign of a box to carry 30 one-pound cans of saddle soap carry 30 one-pound cam of sacare seeps awed 43 per cent in cargo space. A box designed to carry 140 pounds of cannon powder was redesigned and effected a saving of 14 per cent in cargo space. A box designed to carry two Browning automatic machine rifles with equipment

THE SHOE THAT HOLDS ITS SHAPE \$4.00 \$4.50 \$5.00 \$6.00 \$7.00 & \$8.00 If you have been paying \$10.00 to \$12.00 for fine shoes, a trial will convince you that for style, comfort and service W.L. Douglas \$7.00 and \$8.00 shoes are equally as good and will give excellent satisfaction. The actual value is determined and the retail price fixed at the factory before W L. Douglas recan price inseas at metactory centre W. Lbougas mame and the retail price is will be used to the bottom. The stamped price is W. L. Douglas personal guardiantee that the shoes are always worth the price paid for them. The retail prices are the same every they cost no more in San Francisco than they do in New

Stamping the price on every pair of shoes as a protection against high prices and unreasonable profits is only one example of the constant en-deavor of W.L. Douglas to protect his customers. The quality of W. L. eaver or w.L. Designa to protect his customers. He quality of wind Doughas product is guaranteed by more than 40 years experience in making fine shoes. The smart styles are the leaders in the fashion centers of America. They are made in a well-equipped factory at Brocktos, Mass., by the laghest pand, skilled shoemakers under the direction and supervision of experienced men, all working with an honest determination to make the best shoes for the price that money can buy.

CAUTION—Before you buy be sure W.L.Douglas name and the retail price is stamped on the bottom and the inside top facing. If the stamped price has been mutlated, BEWARE OF FRAUD.

bow of the b nat an two very powerful in night landing When in flares for use in night landing nares for use in high landing when in use, they are drawn down by elastic cords so as to project disgonally towards the point of landing they are ignited electricelly and throw a strong illumination upon a considerable area of the water below

### A Megaphone of Novel Design

(Continued from page 548)

placed at the small end of the megaphone bounds in the air, such as that of an air-plant may be located by this method The megaphone is held with the major axis of the aperture horizontal and then moved around in a horizontal and then moved around in a horizontal circle until the air-plant sound is heard. This locates it in a vertical meridian. The mogaphone is then turned with major axis vertical and moved on the vortical meridian until the sound is again a maximum when it will be found to point directly at the airplane.

This may be done with the eyes shut and more quickly than it takes to tell it

The form of sperture need not be ctangular An elliptical aperture walk bring the same result , the essential condition being that one axis is greater than the other and both proportioned for maxione other and noth proportioned for maximum effect to the average wave length of sound. It is applicable for music as well as speaking.

# Heating Water by Means of Electrolysis

(Continued from page 552)

Cylinders fitted made one another, are here used instead of plates. In order to make it as compact as possible the cylinders ace placed very close together, being separated by 4 mch. The can is something like a coffee put being 10 mobes high and an inches dam. The three plug connections D I F are for the three phases. The cold water passes first into the in portion of the can and then flows into the spaces between the cylinders, and so reaches the mouth G. It can be hung on any water tap. The temperature can be any water tap. The temperature can regulated by cutting out one of the phase exactly as in the other type. Tests he shown that 25 amperes at 220 volts w boil one gallon of water According to the speed at which the water passes through the can its temperature will be warm or

### Recent Patent Decisions

Will RI a defendant sold an infringing VV washing motor, and the ordinary sales unit consisted of the tub fixtures, and infringing motor held that the profits from the sile of fixtures could be recovered only not from the fixtures were useful solely it connection with the style of motor infringed and complainant could not recover prints on that part of the hatures which suld be used in connection with other styles of motors. An infringer, accounting for profits, is entitled to credit ing art cle Where the infringement was deliberate all doubts as to profits should be resolved against the infringer -Coffield Motor Busher Co v Wayne Mfg Co, U S CCA / W)

In the patent for an invention to treat the hum in body by confining and applying electric light and electric heat by means of an enveloping chamber the record discloses a former patent assued to one Gohim m 1900 It shows that Gohim conceived the idea of applying heat and light generated by electricity to the body below the shoulders. He used two struc-tures on a mounted on a standard and wheeled up on either side of the bed of table on which the patient rested. From these supporting standards curved partiproje ted inwardly and formed a top, and stantially the length of the human body Curtum were thin drawn at the end of each damber and the electricity turned on Iwo and a half years after the issuas of this patent the patent in suit was applied or It is quite manifest that when the patent in suit was applied for the applicant was tinsware of what Gohlin had done or on his patent and realized his own improvement. Then he filed a new application properly discribing what he brought into the art. This was a simple coastly movable, readily adjustable apparatus withoutstand-ards or support. It was adapted to take such different forms that it could be used on any lunb or part of the body, and thus oreate a hamber which could in size and shape bring its walls into closer relation to the memler to be affected by its radiated heat and light He dispensed with stand-ards by suspending his simple apparatus by coling cords. This allowed it to be by coling cords. This allowed it to be swung about and to be placed in any posi-tion desired. It could be picked up by a handle. He used a hinge which allowed the sides t be adjusted and wrapped about the heated part. Held that the patent is entitled to a construction broad enough to protect the valuable contribution of the patentics to the art -Edmands v Periman

The wardrobe trunk was produced by Seward at first, and had in combination a gate hanger pivotally mounted within the over portion, brackets extending laterally from said gate hanger, and garment hangers having a two-pointed suspension mounted upon said bracket As soon as

But it is in the face of such obstacles that Republic quality shows steelf most significantly

Frye & Company well known packers bought their first Republic several years ago and have seedally added more until they now have eleven They say The satisfactory service which our first Republic Truck gave us has been duplicated by every Republic we own

Cudahy Packing Company operate 15 Republic Trucks They say Our Republic Trucks are the most satisfactory trucks which we have in

E B Holmes Lumber & Fuel Company say "Our hauling problem is a difficult one but Republics have solved it absolutely handling overloads of heavy materials economically over

Whiz Pish Company have used Republic Trucks

for four years and they say The first Republic we bought is still working perfectly As our business has expanded we have added more and expect eventually to use nothing but Republics

From practically every Seattle user have come similar expressions of approval. They are buying more Republica whenever they add to their fleets. The number of Republ is in Seattle is growing at a rate that is significant to the truck buyer who seeks an answer to the question of the best truck to buy

Not only in Seattle but wherever trucks are used you will find Rejubl performance emphatically endorsed by the repeat orders for Republic Trucks which owners commently continue to place

More than 1400 Republic Service Stations so located that every 1 irt of the United States is served efficiently contribute to the satisfaction of Republic Truck users

# RAYMOND ROBINS'

# Sensational Story of **BOLSHEVIST RUSSIA**

# begins in the Metropolitan

I shall adopt the spirit of what you say in semething I am writing as to the lesson of Russia for us. There im't anybody in this country I am so arrives to see and to hear at length scattly along the lines you speak of as you THEODORE ROOSEVELT in bitter to Remand Robin to Suppose 1918

PAYMOND ROBINS

of terror, has consented to tell the story of Bolshevist Russia to the American people through the pages of the Metropolitan Magazine

Raymond Robins went to Russia for the Red Cross in the early days of Kerensky. His appointment was the result of Colonel Roosevelt's earnest plea

Roosevelt knew his man Robins' job was to feed starving women, and children When Kerensky fell and Lenin and Trotsky rode into power it was still Robins' job to feed those who hungered. It was no time for

quibbling or for politics It was time for bread. Robins went to Lenin and Trotsky He demanded a free field and no interference Would they trust him? They did and Robins became the unofficial American representative to the

Bolshevist group Robins will tell the whole story-for the first time, the real facts Grown-up America should not fear facts It will be supplemented with reproductions of sensational documents, the existence of which has never been suspected and which light up every step of this remarkable story It is dramatic, thrilling narrative of adventure among the shifting and turbulent scenes of an uprising of one hundred and eighty millions of people

capable Lenin, planning behind his slits of eyes a world in revolt These two men Robins saw on an average of three times a week for more than five months He learned their philosophy from their own lips.

Hard, begins in the June Metropolitan and will run for six issues

# Wasted Horsepower—and the G. T. M.

It was a spendthrift of power and a trouble maker of the first class, that main-drive in the El Paso Brick Company plant. Some years ago it was all right, but as the company grow it got worse and worse. Every kind and many grades of belt were tried on it. They slipped and jumped and stretched. They wasted horsepower-hours by the hundred. Most of them lasted only four or six months. The most expensive ran their unreliable way for about a year. They made that main-drive one of the most costly things in the plant. Finally the manager, Mr. Rodgers, saked a G. T. M.—Goodyear Technical Man—to call.

The G.T. M.—our Mr. Wetson—was told by Mr. Rodgers that it was planned to try out an 18-inch 8-ply Goodyear Belt of Blue Streak construction, but that it would be a good thing to look over the drive first. The G. T. M. thought it would be a good thing to study the drive—so they went and looked and measured.

There was 300 horsepower coming off a fly wheel with a 40-inch face and intended for delivery to a shaft-pulley with an 18-inch face. But 105 of the 300 were being wasted by allippage, because that line-shaft pulley-face hadn't grown with the plant. When the plant was young it had been all right, but as production and loads increased, it became much too small.

The G. T. M. recommended to Mr. Rodgere that he put on a line-shaft pulley with a face to take a 30-inch belt, specified a 30-inch belt, plus Circuit and was told to go ahead. He did. When the belt came, the C. T. M. went and bought the proper fasteners himself, just to make sure that

they would be the right size. The belt and the new pulley were installed in April, 1918, and that main-drive has been a joy ever since.

From the first more than 100 of the 106 hersepower formerly wasted has been saved. The belt runs with perfect amouthness and evenness even under the heaviest overloads. It hasn't needed attention once. And it costs much less than those that used to slip, stretch and break under overload, and waste a thousand horse-power hours in an ordinary working day. And the Goodysers Belt specified by the C. T. M. is in Mr. Rodgers judgment good for several more years.

There are many main-drives for which a C. T. M. can do similar things—main-drives still belted according to precedent instead of in accordance with the real conditions. Not all of them have outgrown pulley-faces, but many have; and acores of others are using belts of the wrong construction, others have belts made of materials that require such extraordinary lightening that they are hard on bearings, cause shafting to weave, and waste power and time in many other ways.

Ash a G. T. M. to look over your mein-drive. He will call when next he is in your vicinity. He may find it all right—and if it is, he will tell you so. If it isn't, and he recommends certain changes, you are in no way obligated to carry them out unless his reasons convince you. And bear in mind that the main-drive is the most neglected, taken-for-granted, precedent-burdened drive in three plants out of every four.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

# Every community should have roads like these-

a g a d of fleet of the liberty T uch,
past hog Dak lie De auwer,
(o s l i 4 gust 1918 over
a R a i 1918 Kute per
e n of oad af er two years

LERE is the story of how Delaware County, Indiana, got good roads, as told by the County Surveyor Every one interested in good roads should read it

'Our first Tarvia road was built in 1914 Be tween 1914 and 1918 we constructed sixteen streets and roads with a total area of about 2880 000 square feet

Some of these are main streets in the city of Muncie others are main roads subject to heavy traffic while others replaced low lying gravel roads that used to wash out at every overflow of the river Freny Parvia road and treet in Delaware County has given uniform satisfation. No re pairs have been necessary

Our so called hard roads built of bink of concrete are often damed as permanent cen structure but we have in this and but ke has and attreets built less than a decade ago that are almost impassable and must soon be rebuilt New material will be required because the old brick cannot be used again.

On the other hand when a larva road wears a little stone is added Tirrua is applied and the road is as good as or better than new

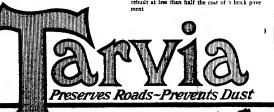

With proper maintenance in Tarvia reads will last ten to twenty years. The cost of mun tenance will be small and the entire road can be rebuilt at less than half the cost of a brick pave

Considering the virtus types of 194d from a purely from I standp nt one discount need to be skilled in higher mathematics to arrive at the orrest inswer.

(Signed) S. Horace Weber, County Surveyor

Invia is a coal tar preparation for use in constructing new micadam rouds or repairing old ones. It rein forces the road surface and makes it not only mudless and dustless but also water proof. A few Tarvia Roads in any community will add to property values and reduce taxes.

The deep subway station at Park Place, New York, showing the escalator system as it will appear when completed

### The Park Place Subway Station Escalators

This Seventh Accini subway coming down the week and of the New York, or turne east at Park Place passing under the Past Office and on to William, where it turns downtown again and extratillar rine under the Last River to Brookkin. In the course across town it must are under two existing subways namely the Brookkin Rapid Trainet Subway which runs under the Brookkin Rapid Trainet Subway which runs under thought at the point and the old Interbenough Subway which passes under Park Row. The simulate it in recessive of the subway at Park Row to down the total passes of the Park Row at Park Row to down the total the Park Place station have a long climb from the station platform to the street. This actual vertical distance as \$8.52 feet. In other words it is a thrice story climb, a brathless undertaking for many persons.

undertaking for many persons
When the station was plaused, provision was made for
a pair of establists to carry pass mere to and from the
relation platform of the state of the state of the state
and platform of the the halo of type of collaboration were
relation platform in the the halo of type of collaboration when
the state of the state of the state of the state of the collaboration which would seconmodate three persons
abread on seach stip. It was thought advansible, however, to use narrower escalators than these, so that four
of them could be installed. The purpose of this was to
provide greater flexibility of operation for each could
be driven separately and a design was shown which
would permit of n versing the escalators so that, if demarkle, the majority of them could be operated to earry
passengors upward in the worning rush hours and downward in the evening rush hours in klawses adapted to

handling crowds on special occasions.

There are two well-known types of escalator in common use, one known as the step type and the other the cleat

type. In the step type, the steps are arranged to run out on the same plane at the eq and bottom of the secondator so as to form platforms. It can from not entrance to the escalator. The possingers step upon these platforms from the sit and in leving the ces into there is a diagonal shaut which would naturally guile to posseniger to the odd of the platform. We have been seen to the coral ton it is not advisable to have the passening rest of the end of the nowing platform owing to the diagor.

plates with the teeth of the combs projecting between the charts of the steps so that they will automate ally but the passengers leet of the st-p upon the fixed platform

The ses daton who has now being installed and may be in server by the first threat the published has a capacity of 5000 pressing reperhour and it rises at an angle of 0 diagrees, numing at the rate of 90 feet permitted Long experience has proved that a higher rate than this is agit to cause injury, to critical species with the season injury, to the season properties which the season injury to the season provided from the simple season injury to the season provided from the simple season injury to the most than one person of our occupy, a step at a sangle time. Fich step is really a platform on which in passinger can stand and this is the risaon that it is so much deeper than the ordinary to distarways step. A 22-horse power lecture motion is used to operate the scallour which it does through a worm pair. An international contribution of the provided in the standard motion steps remaining under those of by the truming on of the motion. The osciolator rises 28 feet from the station platform to the measurament of the measurements.

At present to the conditions at the Park Place subsets station are such that a single condator will more than vectumodelt all the passingers travelling in a single direction. Two cealators will be ample for all the traffic for many venue to come but looking into the fature provision has been under for four ceal triers, and our artest in the accompanying organizations has given use a plet equipment is modalful. The hand starway is, which provide the only means of ingress and gross at present, are shown in plantation in the engraving.

### To the Mayor of New York

I the mayor of this city should have or make or ase a to walk a ross the Bracklya Bridge by unmertakable evalence that this great structure or suffer ing from a neglect which shortens its life and if it extends to the whole bredge may well it threatening eta sefety We refer to the pine in the tep churchs of the stiffening trusses adjusing the promesade where any powerby may identify several worn pins by the brost stre ks of rust which surround them and discolor the steel work below So great has been the correspon that some of the joints show a went of as ion h as an eighth of an meh Hem is present by the fact that under the lead of a passing train the nuts which hold the pins in place have a lateral movement of that amount re turning to their normal position when the train has When it is concubered that the assembly of thord evilars and post at a panel point is supposed to receive the pen with a tight ht et clocs not take a bridge engineer to understand that the structure at least in the particular part of it has been subjected to a shocking

A great engineering work nuch as this if it be carefully
and periodically inspected should be as enduring as the
Pyramids but if it be neglected its determination will be
progressive at an ever multiplying rate. However,
question naturally areas as to whether the evidence of
neglect which any passer by may as for himself extends to those parts of the attracture, which are remote
and require special facility and the transit eye of a support for their proper inspection. Indied the city
authorities have only thomselves to thouch if the etheron
of New York and Brooklyn assume that the whole
bridge from anelionings to auchorage is in a similar conoften of weller and discusser.

The Scenarios Assentian has fell a pastendar in trends in the question the care of this attracture since the day in link 1901 when senilar neglect came very near to ensuing the whit filese of the linds to break away senifron the suspenders and man eables and drop into the familiar seniform of the matter was decisiond in our senior of August 3d 1901. The salient firets of these near-dissistanters and follows:

At the center of the bridge t all w for the lateral neaveneest of the trusses under the action of the passing trains and als f temperature changes the suspenders which the truss and floor are loung from the main cubles are pr vil I welle rocker beatings where their lower ends come t with the trusses. Due to neglect these bearings her too hadly rusted. The pins moved with great resistance of at all and the reverse bending stresses thereby thrown on the suspenders which at the conter of the bridge were ashill rods ultimately caused them to break in two leaving the floor at that point without their support. It sagged heavily, being now held up merely by the cantile ver action of the floor beams which fortunately are continuous from side to aide of the bridge. The lossy building stresses thus thrown upon the floor beans were cutarly additional to the load for which they were designed and that they should have saved the saturation as a tribute at once to the

excellence of the material and the forbearance of a kindly Providence

Luckily the sag of the roads of happened to be noticed by a bridge policeman. We say 'luckily for had a few clossly-bunched rolls or any thore was no spating of cars in those days) with a bary dray or two to say inching of an slevated train possed amunifaceously on to that part of the roadwax it whole floor of the bridge would have commenced: 1 132 sway from the suppond in which accumulative as (1) in

And what is the condition of it is moker joints today? We recome they are regularly suspected but the millions of citizens who make use if his structure would like t first assured that the negl t which as would on the promen said does not extend to the bridge as whole

the premented does not extend to the Proofs as a wone.

We have no wash to play the droot. In Brooklyn
Bridge as perfectly well able to try its present load
provided always provided that the city offstale are
giving it the close imposition also hevery great bridge
should have. Particularly us it try. I as mammels are
turn out has behat desenably if a cettle per sol safety.

### Boy Scout Week

OW many of us have it justely usualized the increment which was added to our great manufactured of the Boy Results of it was pears through the inferies of the Boy Results of it was we all are aquanted with the existence wid or no rikes with the same of this admirable organization but are we not medicated to passe over its perturement when it a dur-mend of relative askinoidely one?

When the Nation called the it a wouls then 300 000 strong responded because they were prepared In the tret four Laborty Loan compaigns acting for the most part as gleaners after the 1 p rs the, sold 1,967,-047 bonds amounting to \$270.714.650 Fhey placed War Savings Stamps in excess f \$50 000 000 in ated 5 200 carloads of stan line, walnut and collecte over 100 carloads of fruit and nut | its | 1 bey distributed over 50 1100 000 pieces of Gover ment literature. They conducted war gardens and was firms throughout the country | They rendered all serie of invaluable services to the Red Cross the United War Work Committee, the American library Associate 1 and various other organisations that were serving the Covernment They Lovernment which are not recordable under any particular ilassification They presented a united front patrictic scal in every community which in itself was of incalculable value to the nation

Not alone to the boys who del these things is credit due. To the bundred thousand men who have acted as secutinaters, committeened ouncel members and officials only 250 of whom are paid the revibering continuous continuous and the revibering their efforts which is involved in recognition of the Boy Roule as a real force in the community the state and the nation. It is for this reason that hastoonal it issues committee, under the Chancinathy of expressing McAdoo leas been formed for the purpose of expressing the nations appreciation of what the Boy Recut and America did during the war. This expression will take form of a nation-wide Bry-Yeutt Wack from June Rith to 14th. It will sam, among other things to foom the attention of the publis on what the Boy Sout movement really stands for, the immesse part it played in the war, and what it is expected to do in the future.

I stemally, perhaps, the promunest feature will be the effort to get into the Boy Sevite every boy whe will benefit by the associations who he they follow him and the sideals they held out for him who he mean every boy in America. But for the thoughtful citizen the Boy boult will mean far more than this. It will mean closer contact with the agencies which have taken the vast rear your of boy power, so often turned to muchaevous ends and diverted it into thunts where it is of termendous heanfit allies to the boy and to the rest of us. The is what he Boy Sevota stand for

### Further Light on the Shipping Situation

I h our cause of May 17th 1919 we referred to the views of an experienced shipoware and operator, Mr Robert Dollar, on the shipping attuation, and subsequently our attention has been directed by Mr Hurley, Chairman of the Shipping Roard, to a raview of the sphysic by another will-known argert, Mr J H.

Rossetor, director of the Division of Operations of the Shipping Board Inasmuch as this is based upon 30 years of practical experience, we take pleasure in laying a digest of Mr Rossetor statement before our residen

We are remarded in the first place that the amount of vagos paid is to be properly measured by accomplishment and the authority believes it would be a mintain to reduce either the wages, qualify of food, or the number of officers and men employed on American shape, suce has experience has proved that the more efficient service reduced in well surch the higher pay and better treatment. He admirst that we are subject to unaccession. Contact in the form of tonage measurements a matter which should be immodiately adjusted.

The above, however, are not the really unportant tenus Upen the Great Lakes we have, ready to hand, an example of the possible low root of water-house commerce Hare we find that American-built and American-manned ships are headling and carrying earge at the lowest cost per four in the world s commerce If, under the spur of ancounty, we have accomplished this realit made for feart Lakes we surely, by suminar methods applied in a broad-mined way may expect to achieve reommensurate results in despense traffic Mr. Rosseler state is that the higher cost of manning has been exagented anner in his experience it amounts to less than 2 per cent of the total operating expenses. This is far higher Mr. Rosseler shallow Mr. Robert Dollers estimate, but Mr. Rosseler hillow r has the many case, the higher cost can be more than offert by increasing the speed of our ships and breaging our equipment for loading and discharging up to date. Another advantage over our competitors whiph is

fundamental and permanent is the vast supply of oil fuel which is available for our merchant murine. He states that with the ordinary reciprocating engines one third greater distance can be steamed with a ton of oil than with a ton of coal, and the great majority of our competitors are using, and for a long time to come will use eoal. Not only is greater distance made, but it is done with a very considerable reduction in the boslerroom force The numerous 'black squad will gave way to a few men who will exchange the shoval for the valves of the oil burners. Other questions which must be fared and for which an adequate solution must be found if our new merchant fleets are to enter into mecentul world competition, are first, improved types of ships and reduced costs due to American methods of labor saving in which we should be able ultimately to lead the world becondly the coordination of our -an absolutely need railway and steamship linesreform if we are to reduce the total cost of transportation from inland manufacturer to foreign consumer the development of efficient maritims organizations, not only at home, but m all the foreign ports of the world, for here is one of the foundation stones without which no successful foreign commerce can be built up. Fourth, shipowners and merchants must be assured of the lower possible rates of marine insurance at least in the earliest days of this great venture Fifth, it is also nece that favorable facilities be provided for foreign exchan and decounts Lastly, and we commend the feature particularly to the careful consideration and speedy action of Congress, such conservation measures should be authorised as will assure for our great merchant fleet an adequate supply of oil fuel

Before the war, as we have frequently potated out and afforces of a large merchant marans, it was estimated that some three hundred million dollars per year was upon forces abign for earnying its forcing tended in the immediate feature, because of the universal inseress of trade and for our ability to earny not only our own exports and imports, but a fair share of the world's common, we believe that Mr. Rossets's estimated of microsand revenue of over five bundred million dollars per year is not accessive.

per year is not excessive of the present era of checquered history of United States shapping is that great marriams metaphor of Shakespacer "The is a tide in the affairs of men which than at the fixed, leads on to fortune" The United States stands face to face with a great opportunity, never before presented and never in all probability, to come our way again. Them is a call for farmering legislation by Congress.

### Engineering

The Lumber Production in 1918, according to tables recently published by the U 8 broats Service, above a total of \$2,700,000 feet 1 the production for 1917 was \$6,000,000,000 feet, so that the past year shows a considerable decrease in lumber production, this was meet marked in the southern and castern states

The Docks at Falmouth—In a recent issue of the Scientrizo Austria, value docks at Falmouth the final plans show that provision will have be made for 40,000 fest of deep-water whares with a depth of 44 fest alongade at low water, and there will be an 1,100-foot sty dock. At first only about one south of the docks will be built but it is possible that British Ooverments will show sufficient interest in these docks to have the centre 40 000 fest constructed amendiately. The Government looks upon Jaimouth as one of the finast stres for a terminal port and port of all in the United Augston.

Metring a 260-Ten Gas Container—A revent same of the Engravaray Ness Record den rished a novel moving job at Portland, Ore. A gas container 70 feet in diameter and 75 feet high weighing 100 tens, was moved a distance of three miles 1 rist it was reused 15 feet and leaded on rollers. Then it was moved close the city streets and lowered 28 feet to a dock, whence it was moved upon a pair of barges where there it was moved upon a pair of barges where there it was moved upon a pair of barges where there it was unloaded and rared 38 feet moved across newly filled ground for a distance of 3 000 feet crossing a railroad track and placed on its new foundation. It took 71 days to complete the work.

Reinforcing Bridge Piles with Concrete.—A novel example of onnerets work as to be found in the reconstruction of the pile foundation of a long wooden inchway treatle at Port Angels Washington. The bridge at 2000 feet long and crows the bay at thap point on examination it was found that the piles had been badly saken sawy by teredone As it was unportant to maintain the highway trainfo without instruction that piles were not reast wed, but were reinforced by a concrete covering borns two feet square tanded with one rule. The pine of the piles and filled with one rule that was reconstructed by a period of lowest tole and it was not savely to be provided by the piles and filled forms down to keep them from boung floated as the water reas. The forms were made in as foot lengths and if necessary was extended after the first length had been filled with concrete

Raising a Railroad Bridge Without Interrupting Traille—Last year the War Department ordered the range of the Pittaburg, bort Wayns and Cheago railroad bridge over the Allegheny to mercase the Learness by 12½ feet and required that the work let does within a year a time. The operation was printend by introducing jacks under the spans and raising the bridge gradually. The parks were operated only when there were no trains passing and the work had to be done little by little on a single pier at a time, the operations being carried on consecutively from pier to grant of the train of the

Dustiess Macadam Roads.—The roads at the River Rouge Naval Training Camp, Detroit, Mech, have been treated with a surfacein natural of deliquement asia whech have made them dusties and also noiseless where have made them dusties and also noiseless. The great efficiently with water-bound mascadam roads herestores has been to keep them at the proper degree of meisture. They were spit to be too dry, which would result in wasring away the road surface and its dismpation in the force of dust. The causand the road material to break up regardly. If the road wave kept too wet, it was inclined to become soft and would be crushed too readily by heavy loads. But in the roads at Detroit just poferred to, the use of materials such as colotium, magnetium, and other objections from the sail wells, lept the surface at the proper degree of mousture by gathering the monsture from the sit and from the order of the contract of the contract of the first own of the production. A subte yard of the material was found to order production. A subte yard of the material was found to order production.

Testing of Clinical Thermometers in Europe -It is reported in Nature that sime the Chine al 1 h rmom oler of last October was round by the British authorities half a milion clinical th rmometers have been tested at the Vational Physical I il oratory where more of these sestruments are now tested in a week than were formerly tested in a year It is found that about four per cent of the thermometers fail to comply with the provisions of the order I r m firm of makers having a large output, the number of rejected matru-ments has exceeded 25 per cent while in the stacks of matruments that have been sent in by dealers the repertions amount to from nine t ten per cent French government has recently fill wed the example of the British and maned an order making a minute ry the testing of clinical thermometers a ld in I rance and re stricting the types of instruments that may be offered for sale

The harliest Flan of New York —Dr I ( Wadir of the Royal Netherlands Glosqu'i in all Soutt's who has recently carried out extensive investigations concerning early explorations of the region alse ut the present sit. of New York city, has brought to light an earlier plan of New York city, has brought to light an earlier plan of New York than any private has a Avrording to an account of this discovery published in the first graphest Journal, the map sipe as 1) have been has no ensurey made in 1660s and is was regular areas of interreasing streets, proving that even at that private though few houses had been creted the which plan of the city had been lead out, even it the modern shape? The map, which was found at the Villa Castello in Florence is the only one thus far known dating from the period of Duk's plan priserved in the British Dueston Castelled Duk's plan priserved in the British to be in fact only an inferir British copy of the Patch house.

Sizipa' Balinet as a Source of Plant homises—Intowar of the wild-known damp of the introduction of
most poets into this sountry in the sarth around improted plants, it has been sugarised that such prote
may also be imported in the earth used as balinet in sinsturming from Kurope Carvell investigations pit itsuggested danger have been made during the list for
months by the Federal Horts ultrual Board Warconditions greatly increased the amount of bal ast
brought to our sestem ports as transports carrying
troops abroad mostly returned in ballast. It appears
however, that most beliast consects of sand, gravil
broken rock, and somethyse sabes—but when employed
agmentally derived from given banks or firm escavations
for construction purposes, rather than from cultivated
lead, and is therefore not likely to prove dangerous to
plants. The sand and graved thus arriving from abroad is
untally sold for buildings or other construction purposes,
while the broken rock and soil have been used for fills
mast the waterfores of towed to sea and disuped along
with early waste. On the whole, there seems to be
an serious danger from this source.

There is nothing exciting about flight a nert is nothing exciting about flight.

It has also as been a simple pro-edure with
any type of aminal that wanted it. Insects
perfected it 25 000,000 or more years agojust as soon as the triliable, one of the first
of animals, could get used to life out of
water place. water, change his segments and appendages and mount on wings. His lineal descen-dants, the dragon flies, still have to be born claim's, the dragon lines, still nave to to norm from eggs in water, and the young remain their four years before suringing upward on wings toward the sun to dry Lixocetus, the flying his gathers spaced in the water russ to the surface expands his breast fine rask to the surface expands his breast ma-above his back in form of a parachite and gracefully flow. Rhacophorus, the frog an amphibian expands the webs of his hind feet, and sails down out of trees—then hind feet, and said down out of trees—then climbs up and does it all over again Maybe some day he will expand the webs of his fun feet and vault into the empyrean Drace the lizard, stretches out his ribs Draw the linearly strictions out his ribs invested with skin, and volpiance out of tru tops Gorko another linearly as well in morely oxpanding a fining, along the sides of his body like a flying siguired. The bat, a manimal, with feath rives wings made out of his for hings re, flice as well and as far as almost any

Dird P(croductyls as primitive flyers, were just as agile in flight and just as warsed in aux and furm as their specialized successors, birds, today Some of them were species

mes and forms as their speciamons are supported by the feather delucia, today. Some of them were species no larger than aparrows, others ranged up to spreads of wing greater than that of the albatrone. While the peterodactyle had revels, the American pieranodon had a horn-shell beak, althought one not differing chemically from those of some lurde of today, and a spread of wing registic alighted on their feet presently as birtle do libroy saided with folded wings the same as furied do, although some spaces are alleged, by dropping the wards with the time despected. As to numbers, the percentage of the said of th drying up of the waters and thur stundity in not knowing rough to imparts by wing to new regime. Fossibly the majority of them were water replies from which our water birds may have arism. The penguan, for instance, which fire only under water, is but a slightly modified prerodactyl, the latter also

used its wings for under-water locomotion

Heoley says that "ptero-dactyle might have lived like dartys might have lived like see birds or in colonies like penguins — In fact, four genera of pterodartyls were as bereft of tail as the peuguin Furthermore, pterodactyls had pneumatic boses, for the darker of the like the colonies. factive had predmane some, for the admission of air, just like water brds and other types today. Very likely, some of the small species had no such air nameres, for no such air passages, for equally, seme small birds of today have sone Pneu-matir bones predicate a four-chambered heart, summon to

Pieraneden, the hern-besk flying reptile from Crotaceous times in Kansas. The creature was a light-weight, eweing to but twenty pounds

scitvities of an animal. The feet of the pierodactyls were distinctly repulsan. It is particularly in the respect that birds, during 5,000,000 years, have specialised to better types. Williston accounted for this by assuming that the pierodactyl foot was used solely for flight and nover for walking. His premise, however, we kname pieromotion, a beaked flying reptice, as having a bead three feet long, article for some twenty feet, and a weight of only 20 pounds If a bulky ostrath can run faster than a horse on two slender tows, certainly a gigantic pierandom, weighing only 20 pounds, could could yasik on weak toes with rudimentary claws and a free-moving fleming, "giving great freedom of movement

to the hind logs.

Flying reptiles and birds have practically identical shoulder gradies, keeled sternium (breast bone) and formulb bones. The flying reptile illiamphorhya hus and the fossel bird Archaeoptryx each had bing forearm bones, with hands terminating in three sharp claws and identical long tails. The fossel bird, so called, lethtwer may be considered the forest birds of the forest birds and in the charge claws and identical flong tails. The fossel bird, so called, lethtwer may be considered the property of a flying reptile and the consideration of soil birds with the forest birds and the consideration of soil birds and the consideration of soil birds and the size of fossel birds collected these by Marsh of March (18), by was not only associated in life with pit reductively, but was not only associated in life with pit reductively, but was not only associated in life with pit reductively, by which the collected thousands of barnes in the Nobertan birds, of flying reptiles and so-called fossel toothed bards many of which to this day remain unsorted, men of sure having been unable to tell where is which. Of course, in classification, we must distrigued as large that we do not know that all of the many spectros of flying propriets and propriet flying reptiles and propriet on the place of two propriets and propriet of the place of the propriet of

Dr W K Gregory, of the American Museum of Natural History, New York, recently addressed the New York Academy of Sciences on the origin of birds. He said

as a the skull of breis is of a medified reputinan type and has no doubt been derived simply by the loss of the upper temporal bar, by the inturning of the pter gend bones and by the collargement of the intermit interes. In short, the whole architecture of the brei skeleton, as indeed the whole internal anatomy, are unquestenably a modified ton of a primitive reputilian type. The consistency of opinion is that the common amesion was nearly related to the primitive Archosauria, or reptile with two arched skull bones. Far back in the Carboniferous specific propriets and other reptilian groups were very primitive reptiles and other reptiles are groups were very primitive tordy aluggish habits and a highly variable temperature, according to Brown, a small reptile in the Perman of South Africa, exhibits inequent adaptations to active hopping out two feet. Its structure was so generatized that the diverse peculiarities of birds group from the trees of the structure was so generatized that the diverse peculiarities of birds and from the trees peculiarities of birds and from the structure of the structure was so generatized that the diverse peculiarities of birds and

In some types of these Pseudomuchians, the body is known to have been cevered with horny plates, but others may have been clothed with overlaping scales which must have preceded the evolution of feathers, the critical steps in the evolution of birds.

A man is as he thinks, and thinking is a function of the brain. If a bird has a reptite brain, it must think largely in the terms of a reptite brain, it must think largely in the terms of a reptite brain to the terms of a reptite. In the sense that clothes make the bird Hence, the bird is mirely a figure of the terms of the terms of the terms of the property of the property of the property of the property on the property of the property loudy, Mrs. Robin lays an egg and so does Mrs. Alligator.

### Francis W. H. Clay

A FTER an illness of two weeks, Assistant Commissioner of Patents, I renew W. H. Cley, thed at his residence in Washington, on Saturday morning. Was 10th. Mr. Clay was born in Richmond by, I forum; 9th 1849. After graduating from Cornell University he served a brief term as Nesset at Learnman in the Patent Office, resigning in March 1980, to inter-private practice. He pursued this secucosfully in Pitchwigh

The pterodactyl, flying reptile with teeth, as preserved in fossil form in Germany

until 1916, when he accepted the place which he held until his untilnely death

until his unitarily death.

Mr Clay From the family of distinguished beatituks statesmin, possessed to a mari i digit i min of the characteristics of mind and the restrict which his vis made characteristics of mind and the restrict which his vis made made companions by with him is delight and an inspiration. It is not strange that one with his impuring mind and capacity for research should have entired the field invention. As evidence of the fact that his mind did not operate, along a single truck we have the fact that himself was grantee of patents for mentions in secral lance. As a lawver he stood high both with the localed and the bar, and served his clair with singland ability and the state of the control of the

### Good Flotation Oils from Crude Tar Products

THE new flotation process for the concentration of various subdictors has hid a very rapid day of purious in the hast few years and as a result the domind for flotation of be to see in the process has been very great. Pine oils and tar oils obtuined by the distillation of southern pure have been one shaded flotation oils but the tar oils obtained by the destructive distillation of hardwoods have not been one-story.

Recent invistigations by the 1 masts of the Forst Products Laboratory, 1 8 Forst Searce and the Bureau of Mines have shown that several hardwood are nish have a very high flottenia whar. Some of the cude tar products obtained in the of I may operation for making wood incloid made egoc citik good flott tonously of the religious of the cude that the second of the control of the religious of the form of the religious of the form of the religious of the form in the form of the religious of the form in the form of the religious of the determination of the religious of the

These discoveries should make available to the mining and smelting companies a large supply of illutation oils and should furnish a market for word distillation products hitherto used largely as fuel at the plant

### Phosphorescent Landmarks

ACLIVIR and novel use of bummons paint is being made at the British front - There are a number of A made at the British front. There are a number of faintly luminous phosphorescent substances ruch as those having a basis of radium solts and the sulfurous those having 1 mass of runnin setts and the suffurous compounds studied 1. Becquered which give of a funt glow, like that from the first at might or in a dark toom. These have long been used for mixing small objects, such as watch dids match boxes (t. visible at might An ingenious extension of such applications of huminous paint has recently been made in the British some at the front Targe we dea lisks r buttons about 212 inches in diameter are costed with the of resaid phosphorement in diameter are ested with the discissing propherses at point and then covered with a perfective liver of cellu-loid. These disks have a sharp pant on the reverse side by means of which they can be affixed to the ground and the sides of treaches or other earthworks buildings fences and other structures. The buildings fences and other structures. They are perceptible at a distance of from 30 to 60 feet. This low degree of visibility is one of their advantages, since they form admirable landmarks for the troops secuting parties but are invisible to the enemy, rither on the other side of No Mons I and or in the air. They retain their phosphorescence for several months before accding to be replaced. These disks are also used in the hand for giving optical signals, orders and information at a short distance when silence is describle. In a similar a sum distinct which simply was little and the sum of the way luminous ribbons ire placed doing a road by day to indicate the path to be taken at highe. Sometimes, too, luminous letters and arrows not as guide polas, and finally luminous devices placed on the backs of stretcher bearers protect them from being fired upon by their friends. The pertinent suggestion has been made that such signs would be very serviceable for the names

### Do Seeds Breathe?

I is easy to demonstrate that germanating seeds take in exygen and give out carbon dioxide A score or so of peas are placed in a close fitting jar with a small amount of moisture. After a while the peas start to germmate, but soon they cause the oxygen in the jar is exhausted. A single is a in a jar of the same size, however will develop and grow up into a httle plant There is evidently anough oxygen for the needs of the single specimen

lo prove conclusively that there is no oxygen left in the jar in which the number of seeds germinated it is only needful to plunge in a burning match. This instantly goes out 1 like proceive of carbon dioxide in this jar is clearly allown by pouring into it lines water, and thus shaking milky in appearant. The would not happen to any extent in a jar in which there had been no germinating seeds.

The jar contains enough oxygen to support the growth of a single pea-vine

and cease to grow

# Patents and Profits

### Why Does an Inventor Sometimes Fail to Receive the Expected Reward? By Dudley T. Fisher

I'l is noturnusly the opinion of a very large number of people that part it is known in neutron or usually relided at far case to a stable washed a sprinkers by a mass falculous wealth by the exploitation of their ill-y tudens

falculous weather 19 He Ceptoraxion is received to the throught the age over of patent monop lies.

Last summer one of the New Yerl pup in carried a potenter of a woman candidate free inaccess and as companied it with the statement life or 2 the planks in her platform was the date. I the planks in life platform vasion that the statement is the full more opolise, and the statement is the statement of the planks on her platform was the date. an hir platform was the date full more opposition, including profession 1 to 10 we can be the historial hold by a great minery join that a partent is a monopoly whether works it 1 it is maker of the capital and close at the express of the mess. I believe that all mark criticisms arise he raise an entirely errorecture on reptions of the native of the monopoly granted by the United Marks in a 1 to 12 me in work that the White mass first when it does not be found that the property raise and the attronger man kept that (which would be more than the problem) and the stronger man kept that the third with a mark of the saws use. He gradually hearted that with capital is resolve man could more than the problem and the problem are could more than the problem.

the first lumin of I man so for his cours use. He gradually harmed that with c space is resolute man could protect his hanamas from a fellow who wes somewhat lagger and stronger than himself. He titen learned that his favorite space was something which he desired to keep for his spear was seen thing which he desired to keep for he are all the second to the period of the period

for instance when the mineral sang is new song that song became the property of any person whe could remember it to sung it. With the invention of printing it became possible for any fellow who he ard the ministriit because possible for any fellow who heard the insustrict ming for score it he soung in such form that he could still it to the public and the people no longer cared to pay the manter! for sungers, I has the manter! for something of value which had former! been has said there ceased to be any men striver for him to saing. We then because fewer new songer and the public host ange. We then because fewer new songer and the public host of a grouper reward for producing new young. In order that manter law might not be destroyed the propie agreed through there didn't chosen it processations to or cognise the manter law might not be destroyed the propie agreed through them. duly thosen representatives to recognise the ministrel duly thosen representative to reciginate at minimizers song as property only requiring that a record he made of the song so that it might be possible to know whether the printer had really stoten that particular song or had produced a new one of his own. In the same way it cod a m w one of his own produced a new one of his own. In the same way it gradually came to be recognised that a man who discovered a new way of doner some useful thing should be protected in the use of his discovery in order that he might be encouraged to work out such improvements

might be encouraged to work out such improvements
And this marks the beginning of patents
Nohody (ver thinks of terming the exclusive possession
to the strict definition of the word it ovrtainly is one It is also true that the people who object to monopolic with the exception of a few of the most advanced social with the exception of a two risk most survained societa, would belk at applying the word monopoly to the conclusive enjoyant by a farmer of his farm and it seems a party that the thomonus word should have been compled with the recognition of ownership in ideas

coupled with the recognition of ownership in ideas. One very important thing to be remimbered, when considering the character of the monopoly granted by a patient, as the fast that the inwanter by exercising the rights granted to turn by his patient is not depriving the rights granted to turn by his patient is not depriving the rights granted to turn by the patient is not depriving the public of the right could apprehen the public had per viously (11) yell. When a monarch granted a monopoly to the give maker he outstaid the providages of the balance of the people but when a patient is granted to an arcation of as of in with the express provision that the monopoly relates to the injournatio of rights to things which had now is from existed, and that monopoly is the monpoly relate to in "layouth to rights to duling which had in wire before evided, and that municipally is granted as a reward for lumping those things into consistence so that the public may enjoy them at the expiration of the term of the patent. The conditions upon which the patent is granted are

ane continuous upon water as parent si granta are first, that the invention must be new If it has been known before the inventor cannel have a patent Second, the invention must be useful II not useful there can be no conson for granting such a monopoly and the government regards the matter as too trivial to

justify consideration. Third, the inventor must make such a full disclosure of his invention and the manner of sure a run unsqueet or the inventer in and the manner or uning it that the public may have full possession of the invention at the explication of the term of the monopoly. These are the conditions which are imposed upon the party of the hest part to a contract I ctuen the inventor party of the first part to a construct content the inventor and the public in consideration of the benefits bestowed by the invanton the parts of the second part that is the public page to the inventor a recognition of his ownership in his ideas for a limited time. The inventor is ed not make known the fit that he has an in ventor ned not make known the t t that he has an inventor. He may if he can, kep the matter subrely serrer. But experence has shown that it is a very difficult matter to use an inventors and keep it a cret at the same time and that it is very good beanasse both on the part of the public and that it is very good beanasse both seems. The public pay the mev store what is an order to the part of the public and the neventor under the public pay the mev store what is an order to worth and the investor uses he taken to supply the with what it wants

mable, with what it wants. But you will all me, there are many investors who do not reap the rewards which the patent leads them to expect 1 believe the greatest cause for this complaint is the ignorance, on the part of the investor as to just what be has invested. It is almost it in unvesting and of the invested that has serve it more than he readly has done. The more insepprent of the inventor that he has serve it more than he readly has done. The more insepprent of the inventor the grafter is his oversetimate of his investion. Every few weeks I have submitted to more version from men who operate, machines built by the company with which I are connected showing new machines which they claim to have invented and which they used to all to our company 1 here is sometimes a relimmentary hadow of have invinted and what they must to all to our company. There is consistent an immentary shadow of
many there is consistent and invitational there is no interest and invitational
many man arrangements of the parts of machines which we
have shready built, and often the rarrangement would
must disadvantageously in some principles of which the
alleged inventor is entirely ignored:
Another reason for the failur is in unventor to receive
the expected in ward, as medificate work on the part of
the sattoracy. I he description up is which his monopoly
is founded in often so poorly writt i that the very sessent
to enforce, has rightly he finds that his contract with the
uplits does not rover many points which are sees it in

on the investment is now one have the account of the public does not crose many points which are sent that public does not crose many points which are sent that a large, magnify of ease, the first that the present of the magnificant of the magnificant of the magnificant of the magnificant of the contract of the construction that has enteredy together to inform him actioney of some of the magnificant of the magnificant of the magnificant of the investment of the magnificant of the mag

attorny Of posses, good agent writing is just like any other kind of work in that it amort by don's descept? If the best results are to be obtained, there must be no simping either in labor or material.

Another reason for an investor not reserving the expected reward such sha he invested another which adoptive wants. After an investion in perfected and qualcularly wants. After an investion in perfected and qualcularly wants of the only way to profit by it is to sell either the devices invested or the patent. If more wants such devices, the more fact that they are presented with and make people pay for thous, and the seven the more fact that they are presented with and make people pay for though and the intervent of the services  The imaging sense the not report to antivalue of any other many such as the only possible outcomes to whom he could sell shippleness to device the services of developing the majorvarient disulting a model and securing a patent, he solucted the complety to purchase his patent. They dold him that they recognised the fact that his investion was an improvement, but it would not add enough to the soling pelce of their apparatus to justify them in paying for his patent and shanging their designs to conform to it A as aboby else could use the myreation it was not necessary to produce the control of the services of the

vantor. One very unportant connected with the procuring of profit from investores in development. Data is machine as worked out into its commercial form it cannot be successfully placed on the market. Often it requires more high class investion to produce the necessary tools with which to build a machine than was required to ment the machine that was required to ment the machine that Tar frequency to ment the machine that I have for the case of the control of the con

of the most important justifications of the patent system. When France Leckner invested has first naming makine, he was years away from its uncessful application to the mining of coal. He produced a re-markably cude model which convined fough A Jeffry that the idea was feasible. Engineers were considered to deam a practional machine. The machine application to the mining or come life progress a Remarkably crude model which convinced foespik A
Jeffray that the idea was feasible Engineers were
employed to design a practical machine. This machine
was built and taken to the more and it failed absorbing
to through any fault of Mayor than the engineers had
because of the man and the failed absorbing
the state of the control of the control of the control
the machine demonstrated what the strains
were and a second machine was built which really did
work. However, during the first year or two the machine went through a course of development which
changed its appearance so much that its own father could
hardly recognise it. All of this development cost more
money than was get out of it during the first few years
and it was only because the people who were behind
it had sufficient copital and enthussaem that it was
finally placed on a paying base. If either the aspital
or the enthussaem had great ones
accomplished, under Without the protection afforded
by the patent, Mr Jeffrey would not have invested the
machine has been invented and developed,
it must be introduced to the public. That is, the people
must be criticated as to the advantages to be derived
from its use. This often more difficult than to overcome the mechanical difficulties of its inventions and
development. Of the there are age long traditions and
prayuders to the revenue. This development of definement of the people, are allowed to share
in the profits of such sfort, there will be small incentive
for any case to take the very evident rake, passe and
labor involved in its production.

in the profits of such effect, there will be small insmalve for any one to take the very ordinal raise, pame and labor involved in its production. In some countries patents are issued with the provision that if the patentee does not manufacture within a certain specified time any person who desures to manufacture under that patent may apply to the Court and receive a line insee under male terms as may seem yest to the Judge. From my point of view this process to the seem of the process of the pro

# French Naval Policy and the Lessons of the Great War

A Brief Study of the Ships of the War and Their Performances

By Robert W. Neeser

IN the light of experience, the operations at see during the Great War have served merely to confirm the persona teaching of history that see power has played a desinve role in the entetines and growth of the Pression nation. France was saved by her army on the battle-field of the Marne But without her navy, which placed is the ridings the industrial recourse of the Western Hemsiphers and assured her the transportation of maportant rendromensents of mer and material at a monsest when virtory hung in the balance, the hercustra of her soldiers and the genuine of her others and the ground of her others and the ground of her soldiers and the ground on the role of the soldiers and the ground of her others and the ground of her others and the ground of the rolliers of the soldiers of the rolliers of the soldiers of the soldi

final victory four years later
A slance at the chart will reveal the fact that Fran-A glanes at the clast will reveal the fact that France sulpyra as evalue stutation for a martimes nation. Her onesis, washed on three sides by the waters of the Atlantic Ocean, the North See, and the Medistranean See, he in the very path of the commercial see routies which today join Europe with the narshers of the world It has been said often that the Franch people have not have not realism that great opportunity and that blinded by many successes of their arms on land they have allowed their attention to be diverted from what has really been the foundation of their greatest victores—

has really been the foundation of their greatest vertormenses power
The naval policy of France in the years which prereded the outbreak of the war was charactered by a
recolation which was been as the recolation which is a second of the recolation which was power.

The consummation of the

by noting the intensity of the signals. After he determines the line of this signals, he has morely to note whether the signals grow louder or weaker to determine whether he is approaching or reconding from the state.

As for the disaster which befull the C-5, it is said to

Hawker's Sopwith highans, equipped with a 400-hersepower engine

blowing at a high velocity and most lustily. One after another of the heavy anchore on would be blown away, rip cord was pulled by last man aboard the dirig It broke just short of the part engaging with the gas-bag patch. And just at the bag started on its wild bag started on its wild journey, earlying the dang-ling our below it, the last man aboard jumped some twenty feet to the ground

A dirapble, unlike an arplane, is safer in the air than it is on the ground. For in the air it like air than and is not subjected to great eiranis, whereas on the ground it is accuracy to and under the blows of the wind as subjected to me vere strains. Had there been a sind to ground it is accuracy to a course the C-5, the acculant.

recure the C-5, the acculent would not have happened Again, if the dirigible had been tred out to a mooring tower, as the British have done with their small simplifies, the wind would have caused little if any damage 'in all in all the dissester nervi a once more to in-dicate the vulnerability of the dirigible on the ground, and the necessity of moorning

and the necessity of incorring towers or housing fashitus. Then there has been the ill-lated attempt of Hawker and Cartw. who started out on the great flight on Hunday atternoon May 18th, from Newfoundland II overy-thing had gone well, thus from the fashing and these bopwith team would have reached the count of Ireland the next day, some 20 hours after their start. At first there were wild rumors of the sighting of the bopwith off the coast of Ireland and the sighting of the Sopwith off the coast of Ireland and even above: ertain districts of Ireland, but as time passed these runners proved to be infounded At the greens writing, four days after the start of these intropid airning the world is without world from them, and it way met the same fate as an

s one cortain that they have met the same fate as another of their toutitymen, Gustave Hanel, who set out across the English Channel and was never beard from again, as well as the Prochman, Leutenant Bague, from again, as wen see the Mediterranean who at out across the Mediterranean While the Sopwith

urd a wireless set, no land sied a wireless set, no land station or steamer picked up messages from the str-sien Not oven a farewell missage came back to the sasociates of the Bopwith train at Newfoundland Yet the wireless set had a range of over 100 miles, and it would seem that at some time the biplane was within that distance of some of the trans-

dutance of some of the trans-thantic liners and freighters. Lattle hopes were enter-tained for the Sopwith under-taking even before the flight. Heavily loaded, the Sopwith huplane had to keep its engine going at the full out-put, until the load became lighter as the goal was ap-

severs strain on the engine. In all, the fight was to take more than 20 hours' time, and it was regarded as problematical in the ed as problematical in the se whether even the best on engine could maintain awistion eague could maintain the full output over so long a period. Then again, with a drew of two, only one of which was the pilot, there was the great danger of falling askep Military arrans agaged in long-distance of the difficulty of keeping awake of the difficulty of keeping awake during long flights 1 he steady drone of the sugare, the effect of the abser, old air, and the removal the absert of the sugare, the criter of the sales of the sales. arone or the engine, the effect of the clear, cold air, and the general ennus of such flights results in sleep. Hawker was a fine of long experience and no doubt knew

superimes and no doubt knew how to guard against falling broke, direct as a superimental of the long strain, or the armon new adverse weather conditions and exhausted their fuel Again they may draw drifted far off their cours and run short of fuel All in all, the Hawker attempt has justified the governal stepsitions towards the angle-engand sum-kne for the rana-Atlantic flight. In betting odds were lost a superimental of the strain 
it is interesting to note bow this supposedly sturdy ma-chine broke down while starting. I rom press accounts it appears that the Martynaide was rolling along at about 50 miles an hour for the 'take-off, 1-1 when it struck a little mound which broke the under Popul н arriage and dam-aged the machine beyond immediate ripair Thusacci-dent brings out the fact that a small trans-Atlantic machine must be loaded to a point where it

is dimensional over dangeties to "take-off unless the flying field is well-migh perfect Meanwhile our NC boats have been in for an exciling time Starting from Tropessy Bay in Newfoundland, the NC-1, NC-3, and NC-4 had every chance of making the NU-1, NU-2, and NU-4 had every chance of making the dight a success Destroyers were strung along the coute, ready to offer succer of nocessary as well as met win less against for the direction of the arman. Yet only one NO bost came through the 1,300-mile flight, namely, he NO-4, which was the very plane that superferred no end of troubles and breakdowns on the way up to the

me end of troubles and breakdowns on the surface, and ank of "unpumped" in place.

The Nf -1 was forced down to the surface, and ank off Covre, the U.S destreyer "Farrfax" bing unable to salvage her. The crew, however, were saved. # The French Problem of Reconstruction—IV

Some of the Details of Agricultural and Industrial Reestablishment By C. H. Claudy, Special Correspondent of the Scientific American in Paris

It is typical of rural France that almost invariably the first thing rebuilt is a grange or grain barn Your typical French farmer doesn't live on his farm, as doesn his American course. Frunch farmers gather in the hundred of little towns which are so close together in France that one can almost shout from one to another Their farms are for farming, their towns for itsnig, and Their farms are for farming, user towns for hving, some while the town, as a town, may not seem so much in American eyes, it represents to the French farmer all that his life holds of greamousness and social inter-course. So when he begins to rebuild his farm, he thinks course So when he begins to rebuild his farm, ne tunna-first of the typical farm building when he begins to rebuild his town, then it will be time to think of the dwelling. Meanwhile he lives in his barn or a tent or anothine which is half a shelter To aid

a depart or anything which is half a shaler. To adhan as singles anything which is half a shaler. To adhan as Sadding such, the government has ordered more than 25,000 demountable vooden houses of a couple or three rooms and an outbuilding at a cost of less than \$1,000 cach as well as 10,000 demountable farm buildings cottant from \$1500 tes800 sech.

Also, once more, here was good effort lost, for several thousand of these were set up and cocupsed and in the path of the less than the same of the several thousand of the less than the same of the path of the latest the path of the latest the latest the path of the latest the latest the path of the latest latest the latest l rounding a destroyed cathedral The cathedral is undoubtedly the world a most tragic and most wonderful rum, from an tragic and most wonderfur rum, rem an art and a sentimental standpoint, but what of the city in which the cathedral stands? This dead and silent place, those thousands of houses, of walls and fallen stones that once were houses, these multitudes of empty staring spaces that were once homes, these poles on which are no wires, these tramway tracks on which are no cars, these cobbles over which pull

are no cars, tasse coorses over which pass no horses, this town which is now no town—and Rheims is but one of many if the largest Wherever possible French troops are being used to supply labor for reconstruction work. It must not be not forgetting it But she is also not forgetting that idle troops are troops deteriorating and so General Petam s order to all military units located for several days in any one place to offer their services to the local engineer in charge of reconstruction has resulted in a good deal of otherwise lost affort being directed on the rebuilding

profined
One of the great problems, of course as the housing and
the feeding of the army of workmen who will do the rebuilding. But France has recognised this difficulty
and has provided ample funds for both, as well as the
spending of those funds the purchase and the trans-

portation of the temporary quarters the maintenance of lines of communication with the mercut base of supplies for any dustrict to be invaded by reconstruction engineers and labories. I rance has not warred with a Hun for four years with the learning how to support troops in the field. She now has a special service divoted entirely to the sup lying and creeting of barracks when yer needed whether? refugees or for working in

I rance is a country of st in and cement tile and brick.
Wood is little used for building. It is too valuable and
besides it lurns up, and will would build a town which might burn up any time might became a little careless with a segarette, n'est a pas? So the government through its Technical Service of Reconstruction is exnting with various building materials to see how permenting with various panting matterns of the those found in any one spot can best be utilised and has a

THE PROPERTY OF THE PARTY OF

Replanting an orehard in the devastated region of Prance

laboratory in Paris for trying out new situs of construc-tion coment mixing brick making building etc. In addition thas narefully mapped France with regard to hor quarries and other earth found materials so that there may be no useless waste of transportation in getting

there may be no useless waste of transportation in getting area materials to the place at which they are to be used for transportation is the met. If the battle to use a American expression in the whole building program. There is no lack of building material stone by a sand, lime, the, cement, ran be produced and are pri-duced in most of the affected departments. What is madelate was admission, and they not consider the madelates and the second of the second needed is machinery and tools and coal—and trans portation, and it is these things which the reconstruction authorities are trying to arrange rather than the in-dividual details of materials. But it is a slow process with the country to be work I in a run with the best

men killed or went I d and the rest away under trus And all the while it we who work must cat. Hence the recetablishment of agriculture is of paramount in portance portance. Here the government helps with its tractor service although the help is short of the requirements I or instance, two years ago a milli i acres were released from Hun domination of which the half was cultivatable The French tractors plowed 80 000 the French arms 12 000 and the British arms plowed 90 000 of these area lodgs the government owns more than 15 00 tractors of which more than half are for use in the

decastated regions
Usually of course the French farmer does his own plowing But usually he has his own firm beasts to plow with What the German s didn't take his own army did there are few horses and mules left for rural service

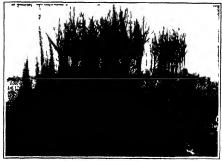

in I rance foday Twelve thousand horses in month were swallowed up in the armore the result is that where the service of Agricultural Reconstitution is otherwise ready and anxious to put refugees back to work on their farins and to provide them with German prisoner labor, it is often ivailable power with which to plow and 800 tractors can't do it all! More over even if some one were to pre ent a twitnoisend horses to the people of France his to I also France couldn't feed the a male if she had them. But she can I ditractors and she has ordered many I ractors and much farm machiner from America are what is needed. And the mid is at least double that of the \$000,000 worth contracted for by the 1r uch government so far

Alterether resumblishing rural krance n a productive state seems to be a vicious irck. There must be crops to fred the animals which must be fed to pull the plows which must function before there an be crops the crux of the matter of

an be crops the rink of the matter of ourse is lad or an U that can to be lad until the military startion permits. Let no American say "Oh devasive of the control of the c

intensively farmed a way
With 50 millions of dillars to its credit the Office of Industrial Reconstitution composed half of officials and half of manufacturers has gone bravely to work to resetablish the shattered industries of France great a task this is can much better be imagined than described. It is not a case of starting up an industry (Cmimu ! 1 pag 188

photographic exectness, but his method does merre of preturing the subject from time to time in the same focal plane and from the same point so that any super-ficial silication will be registered in fixed proportions upon encourage suggester. But how does he make it practicable to measure these contents and surfaces to a newly and that is o'vergingle properly say obsages which may occur? Here as where he has introduced something decidingly mer. On the front of this sheet are two heavy black linea-ress horazontal and one vertural. These lines form a T-fills registering mark at the hottom of each photo-

### SCIENTIFIC AMERICAN

### Some Startling Electrical Phenomens Obtained with New Form of Vacuum Tube

A N enthusiastic wireless experimenter was at work in A his laboratory, when, by chance, he happened to squech the glass builb of he yaouium-tube detector. Immediately he detected an amasing result by means of his telephone receivers. His curroutly was aroused. He wondered why he had obtained that result, and in his quest for the reason he came across a new form of recuum tube for wireless and other purposes

That enthusiastic wireless experimenter was none other than H. P. Donle, now the radio engineer of a large electrical company at Menden, Conn When he filed

his patent papers at Washington, D.C., the patent examiners came back with the blunt statement that his invention was impracticable. Whereupon Mr Donle went down before the examiners with a complete laboratory equipment, gave a demonstration before the expert electrical men of the patent office, and secured a basic patent on his invention

Vacuum tubes, as will be recalled from the numerous descriptions of such devices and their application in these columns, are modified electric lamps used in wireless egraphy and wireless telephony, as well as for land-line telephony Such vacuum tubes can be used for detecting highfrequency electric currents, such as rudio waves, for modifying or modulating or relaying purposes in wireless communica-tion and in telephone work, for generating high frequency current for wireless pures, and for amplifying or building up currents to powerful ourrents

What Donie discovered was that it is possible to pass ionic currents through the glass walls of an incandescent lamp. In fa-

In fact, by placing gases wants of an incandescent ramp. In law, oy placing a metalin cooting on the exterior walls of any ordinary lamp, it is possible to pass several increamperes between flament and this exterior coating with a potential of 20 voits. In order to determine if it were possible to construct a thermionic rectifier in this manner, Donle set to work constructing several tubes containing a metallic filament and a metallic coating on the external It was found entirely practical to pass currents of considerable magnitude between the incandescent fila-ment and the external anode, the operation being about

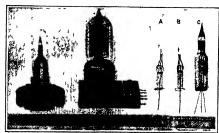

After the filament has been heated for a sufficient length of time to warm the walls of the tube, the electrons emitted from the flament strike the walls and the current is conducted through these walls in the manner descri later on This current passing through the glass increases its temperature considerably and as the conductivity ction of the temperature the current will increase for a short time after the connection is established

The anote current will therefore, depend upon several factors: First, the temperature to which the glass is rused by least from the faluent, so ond, the anote potential, boardes such factors as thickness of glass, distance from the cathode, and so on

Thus we have glass which is heated by the radiation from the filament to a sufficiently high temperature to allow a small amount of current to pass, and by the passage of this current, the temperature is raised con-

The results from tests of this tube showed some very possibler characteristics, one being that the operation depends to a large extent upon what metal is used for the anode A series of experiments on glass samples demon-strated at once the cause of this phenomena

Samples were prepared from a short length of tubing with an electrode fused in each cid. Later many other arrangements were tried, but each gave substantially the same results as the first arrangement. These tests gave

New type of vacuum tube at the left as compared with a standard vacuum tube in the center view. At the right are desired the various steps in making the new tube

most satisfactory results. Conduction through the glass when heated was of quite a different nature from that which might have been expected. It exhibited all the characteristics that occur in conduction through an the onaracteristics that occur in conduction through an electrolytic. The three most noticeable phenomens were 1 Polarization; 2 Increase in resistance distributed from the formation of noa-conducting layers on the electrodes, 3 The deposition of the products of decomposition on the electrodes

composition on the destrodes. With like clostrodes of proper material polyarisation with like clostrodes of proper material polyarisation takes place in hot glass precisely the same as in an electrolytic cell constaining, for materia, a distinct solution of sulphure soid and having platnum electrodes. The second effect, ingression in insistance, was in the construction of a practical detector of the greatest importance. Thus effect depends entirely upon the material of the electrodes, for example in a sample of lime glass with material electrodes, bacted one syd out great 6', and an applied E. M. F. of 20 volts when the circuit was elected the current marks amount to fits multimaterial. and an appared E. M. F. ON JOVEN WHEN THE STRUCK WAS closed the current might amount to five milliamperes, but in five seconds this earrent decreased to less than one-tenth of one per cent of its mutal value. With silver electrodes this effect is almost entirely absent, and with a tube having the electrode of vilver and one of (Continued on page 89)

A Successful Type of Anti-Noise Transmitter and Loud-Speaking Telephone

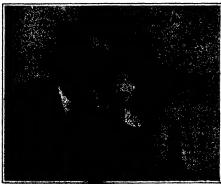

TWO years ago it was the common behal that telephony aboard in hiplane was impossible. How could one talk into a transmitter with one or more un muffled engines rearing but a (ew feet away? How sould one hear with the thundering engines and rush of air and the many other som is mortental to airplane travel? Frankly the problem seemed almost impossible of solution

At first when the call for telept m apparatus for surplane use became imperative not only for intercommunication between members of the crew but

for wireless telephony nyentors set to work on various schemes for bailing out engine and other sounds while confining the voice to a small chamber containing the telephone transmitt; Su h schemes, however were not successful. The roar of the engines still persisted despite One scheme which has been worked out to a relative success consists of a telephone transmitter provided with a mouthpiece having three small holes. The action of this transmitter is based on the fact that the direct impact of the speakers voice passes through the small holes and operates the displiragm while the seen i wave of the roar of the engine cannot pass through the rose of the engine cannot pass through the holes because the semid waves are not in line with their However, when trans-mitters of that design have been applied to multi-nigmed planes such as the Ne Naval boats they have proved unastis-factory and in the long run they have only pieced satisfactory on smaller amigleengined planes

It has remained for two inventors 1 4 Pridham and P I leasn of San Francisco (sl., to develop a really successful and universally practical transmitter for airplane use At first these inventors like most others at work on the problem attempted to muffle their transmitters so as to exclude engine noise. They made most of their experiments in the testing room of an airplane engine manufacturer where dozens of engines were on a daring move they gave up the transmitter and instead, made it absolutely open or stripped of casings of all kinds. They permitted s to come in contact with the transmitter—at the front and at the back all round so as to allow the sound waves to act equally free on both sides of the disphragm. The result has been the balancing of all extraneous sounds are stin was strike the disphragm with qual-force on both stokes attake the disphragm with qual-force on both stokes he nee neutralizing each other, while the vonce wave strike the disphragm on one side only, temporarily distinguing this balance and therefore affecting the curvait

The latest form of anti-noise transmitter designed by Pridham and Itnaca consists of a displiragm and a transmitter button. The button is a t at an angle with (Continued on page 590)

But if the desirably of the gas is for and it is highly expendently.

# A Stethoscope for the Earth

### The Geophone, Invested for War Service, but Which Gives Promise of Great Industrial Value

By Our Washington Correspondent

"TWEE arts of peace are almost all convertible to the arts of war, much more seldom in it that a structly war beyondies finds even greater uses in pance. But compelions the averaging brought into boing by war's momentum has a rude application when war cause and such speams to be the case with the peopleme, a intensity application of the period of the period, for the purpose of the market warms of the period of the peri

ground maning operations and for locating enemy artiflery.

The microphote we have always with us when it comes to deriving any appearatus for the detering of the growth of the property of the growth of growth of the growth of growth of the o of earth vibre

tion of earth vibrations.
The geophone consists of an iron ring about three and a ball under in diameter within the contor of which as supponded a lead dust, fastened by a single bolt through two mine dusts, one of which cover the top and the other two balls dusts, one of which cover the top and the other two balls of the ring. Two hease any mesons are fastened with botte to the iron ring to kold the inno diskins in place, she top one heaving an opining in int center to which is fastened a rubber tube leading to a sixthe-

the miss dusts, remans compensatively motocoless. There is then a relative motion between the instrument case and the land weight and a compression and revaluation of the six in the instrument takes place. Since the rubber tube leading to the stetch-easing any piece is commanded with this sense.

The threadd his proving these is a gas necessary for method, generally or planeting of the histonian out, you are not to be because of the histonian out, you have been to be the first meant may be housed to the histonian out, and the state of the histonian out, and the state of 
connection with mine resoue work has a number of postularities which particularly fit if for the work it has to do. One of these is the resultine with which the sar recognises which of two sounds in two grophones reaches the auditory acress first. Two suphones are used on for each ear. The impression is that the sound in our are louder than the other, that it is not artist is conducted in conducted to the conducted that it is not artist is conducted. ear is louder than the other, that it is not actual loudness however, is proved by the reactions with which an oper-ator slightly deaf is one aar is at it to orkint sounds. In using two geophones, it is not nly necessary to move them about against the well through which the vibrations are coming, until a point is found where the sounds have

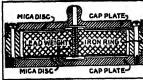

Diagram of goophone showing the stheme of operation

the same intensity to both any. I be direction to which the sound comes, then, will be presented to a line connecting the two instruments. Whicher the sound be in front of or behind the abserver; as matter for further observation, but it results determined.

further observation has its results distributed with such an ameriment in its mean in mine received on the best appreciated by those who have attempted to locate measured numer by robor means Knowing where to dig and in what direction is often three-fourths of the resucce amounts.

The successful is extremely an analysis not only to vibration, but to variations in the vitations so that it is very many to detect the source of its sound whether it is

and a sledge pointing run be heard 1150 feet with nufficient elearness to enable the dre treat to be accur-ately noted. The explosion is an ounce of dynamic transmitted ware surgs, it makes due sound in the geophone for more than two thousand free

geometric for more than two thousand tree.

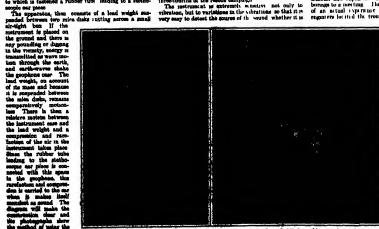

Another surprising feature of the geophone is that the
prising of intercenting rooms gill rise and extress
were to have little effect on the resulting sound. Apparently the earth waves are transputt d in all direction

paracity the earth waves are transmitted in all directions and are pair, it up by the groupons without much it gard to the continuity of insirt rail between it and the source of the vibration. Have a sery important factor in considering the metricum at as an and is miner review or while the groupons will bosset but direction of a source of wave institutes with great accuracy it cannot it instit determine distance. There are the ways of inough the out I vegetate experience will be a supported by the contraction of the distribution of the contraction of the co accuracy how far distant a recognizable s unit may be produced providing in kin as the general character of the earth through which the vibration is coming the other method of course, is to use two sets of graphones and locate the sound source from two directions. Having matter of anthoutu

Matther of arithmetical Another phi norman of the grophone is the readment with which it picks up seamly through the mine cover, although this resimiler is largely inducenced by the state of the air suited in, any great amount of breeze seriously

of the air activa it, any great amount of beere security interfering with its action. The property of the prop

drift and rame supposed to meet had missed Observations were mad in the drift of pounding, in the raise and then ervatious were made in the rank of boundings in the drift engine (re concluded that enginers concluded that the two had mused by about mx feet, and named the direction of each from the other Not willing to trust the pra instrument the mine operators invasted on a survey but when it was made the result was as already determined by the graphone. The matrument is particularly useful in direction datasets to a metal mine rather than motel bearing rock transmore clear-cut mann than coal This is prob-ably because there is some reverberation to the sound from a blow on wood, while on the stone the sound is clean

A gaughose sporter leating a miner working on a coal rib, through 600 foot of intervening rock

pack, hammer, explosion, first, running soler or whatever the same of the actibitives may be An experiment was noted by a Bureau of Mines equines who first may not be a Bureau of Mines equines who first may be desired by 12 disferent stimules and expensivering operations be was able, with east, correctly to name nume of them and accurately to describe the other three sounds abbough they were too unfamiliar to him to allow him to name them.

While not malingfied the grouphone is not marror in its maps, a post orbitizing one of the use of the page of the stimules of the substitution of the same of the

Observations wire made in anyther rase which was being driven up, about six or eight feet distant from a drift. Observations were made in the drift of the sound from the drift in the rase and a point located on the side of the drift behind which the drift in the rase, was apparently operating. The survey mark was two and one-fall feet to the right of this mark. A drill set up and operated at the survey drift in the drift located by the geophones reached the ranes and proved the geophones reached the ranes and proved the geophone to law the survey drift in the drift located by the geophones reached the ranes and proved the geophone observation to have been correct within a few include.

# Six Great Inventions

How Gargoyle Lubricants cleared the way for their development

SPERM oil and tallow. Lard and suet.
These marked the limits of lubricating less than 60 years ago. Present high speeds were undreamed of.

The engineer swabbed his slow-moving pistons with a brush dipped in tallow. A ridiculously bulky mass of metal was required to produce small horse-power.

In 1866, Hiram B. Everest erected a small still in the back yard of Mathew Ewing in Rochester, N.Y. He believed it was possible to distil the whole body of crude petroleum into kerosene, but found it was impossible to escape a residue which had no commercial use or value.

A study of that residue marked the beginning of the Vacuum Oil Company. Mr. Everest, as president of the Company, lived to see Gargoyle Lubricants known the world over.

For step by step, Gargoyle Lubricants replaced lard, suet, sperm oil and tallow. Today the red Gargoyle is recognized the world over as the symbol of scientific lubrication.

One of the greatest sources of pride to Vacuum Oil men is the part their company has played in quickening the development of useful inventions. Six instances follow.

1880 HIGH SPEED SPINDLE

Early ELECTRIC

1002 STEAM TURBINE

### Stationary Steam Engine Lubrication (Late 70's)

PRIOR to the production of Gargoyle Cylinder Oil 600-W stationary steam engines were lu-bricated with tallow.

Gargoyle Cylinder Oil 600-W was the first successful petroleum . lubricant used for steam engines. Its success was so marked that a large number of imitations soon appeared. But to this day no other cylinder oil is so well adapted to the wide range of steam engine conditions as Gargoyle Cylinder Oil 600-W.

### Automobile Engine Lubrication (1877)

N 1872, Mr. George B. Selden set out to invent a mechanically propelled wagon.

In 1877, with high heart he booked upon his finished engine. Then came a setback. He found that none of the animal or vegetable lubricants then in use would give adequate service on this new kind of internal-combustion engine. So great was the inefficiency of these oils that Mr. Selden practically gave up the idea of perfecting his engine for road service.

Later in the year he learned that the Vacuum Oil Company had prochared a new, clear petroleum lu-bricating oil. He secured a few gallons. The turning point was realized. The problems of oil decomposition and highly offensive exhaust smoke were wiped out. The new oil lubricated his engine with high efficiency. ahead with his work. He went

Mr. Selden paid that oil the fol-

lowing tribute: "It is beyond doubt that the Vacuum Oil Company was the first to make a suitable pure mineral oil that would lubricate a gaso line automobile, and I was the first

Today Gargoyle Mobiloils supply scientifically-correct Inbrication for each make and model of automobile, motor-truck, farm tractor, motorcycle and motor-boat.

### Electric Generator and Motor Lubrication (Middle 80's)

N the middle 80's new designs in Electric Generators and Motors introduced the new speed of 1000 revolutions per minute. This brought up a fresh lubricating problem. The Vacuum Oil Company turned to meet it. Gargoyle Arctic Engine Oil was produced to meet this lubricating need. Although other oil companies later offered oil of almost identical specifications at half the price, users found Gargovle Arctic Engine Oil far more economical.

### High-Speed Spindle Lubrication (1889)

I N the early 80's a relatively thin oil was used for spindle lubrication. The Vacuum Oil Company's engineers, however, be-lieved that the oil was unnecessarily heavy for the work-resulting in an unnecessary waste of power. After a period of experimentation the Vacuum Oil Company produced Gargovle spindle oils. Textile mills reported a marked saving in coal bills on changing to these lubricants—frequently as great as 40%.

Electric Transformers (Estly THE first transformers handled currents of from 2000 to 3000 volts. The higher

the voltage the greater the heat. A petroleum product is here used as an insulating and cooling medium.

This new problem was met when the Vacuum Oil Company, working with the electrical companies, produced for them distinctive grades of Transformer Oils specially adapted for their appliances. Manufacturers were thus enabled to raise the early voltages higher and higher. Today 90,000 volts are possible.

### Steam Turbines (1902-

S TEAM turbines presented two new hibricating problems: (1) They operated at speeds of 1800 to 3600 r. p. in. (2) Water tended to get into the system which, when churned with the oil, formed a sludge. This sludge would often choke the oil pipes

The turbine problem centered about the production of lubricating oil which would not sludge and which would readily separate from water. After extensive research and experiment, this problem was met through the production by the Vacuum Oil Company of three grades of Gargosle D. T. E. Oils.

VAST share of the progress A of mechanical invention duiing the past half century would have been impossible without marked progress in the science of lubration. The contributions of the Vacuum Oil Company during the past 50 years are generously appreciated by power engineers the world over.

The future of invention will doubtless present fresh problems in lubrication. The Va uum Oil Company pledges its resources to meet these requirements as they arise.

The work must go on

# Correct AUTOMOBILE LUBRICATION CHROCK Mobiloils

### A Concrete Pit that Saves Money for the Farmer

Will the price of fertiliser going up the farmer is turning to the at di-waste on his farm and finds it a valuable asset formerly little care was taken to get the best results from this fit har When thrown from the stalk at h s ! When thrown from the stillent help and allowed to distribute the plant food contained in it. But the modern farmer binds it is the while to go to the small expense of rating to concrete pairs on his plant is hidd this manure from the still. I arms ly one of the modern farmed by a manure from the still. I arms ly one of the modern studied pairs of the Gridkel was lost cuttinely and that was the liquids was lost cuttinely and that was the liquids and an other preserved for the way to be a still a st use the aboressing device this farmer has a manure conveyor which trans out on a trible to the pit and can be dumped wherever wished by the man in the stall a line saves much time which is a large factor on the farm

### First Aid to the British Motorists

I has remained for the Automobile Association of I ngland to establish a system of first aid stations for its members

slong important routes in fact with this sys-tem installed motoring is bound to become a more or less tame after which is more to the liking of the motorists of the old wall

The first-and system makes use of a large number of tch phone sta-tions metalled along the most important roads The mot rust who comes to graf has but to go to the nearest thephone station and call for aid provided he is a mem-ber of the Automobile Association of Lugland

-to-motorist motorcycle and side car under way The marest first ail station responds by means of motorcycles with side cars win hearry the necessary tools and equipment for making all the accessary repairs. A stretcher is also inchilded in the equipment in the event that the accident is one of personal injury and by strapping the injured motorist and stretcher on top of the side early becomes possible to make good time to the nearest

# An Egg-Mailing Case That Does Not Have to Be Handled With Care

THERE has been no cod to the boxes and crates and packages designed for the transportation of eggs by express or parcel post. Some of them have preved parcel post. Some of them have preved reasonably effective in actual use, but for the greater part the eggs have not

for the greater part the eggs have not had the proper protection when subjected to the roughest handling. Backens of Jacksonwill Fia to design what appears to be a satisfactory coate for the trans-portation of eggs by expose or parcel post. As will be noted in the accompany-to-desired properties of the satisfactory of the safety of the properties of the properties of the safety of the properties of the properties of the safety. post As will be noted in the a company-ing drawing which is more or less self-cyplinatory the crate consists of a corrugated eardboard box and a protective structure of cardboard strips Starting with the bottom, the crate make use of a number of crossed strips of card-board, shown at A Resting on this framework of crossed strips is a piece of "ardboard, B cut with a large number of crossed slite, the intersection of each

A concrete manure pit that prevents an important form waste

pair of slits being above the center of the lattice-work squares. Then comes the arrangement that forms the 12 egg

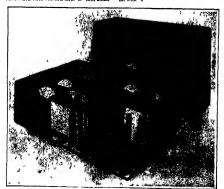

more lattice-work, G, in the top cover The cardboard with crossed slits represents a remarkably resilient surface to the end

England's first-aid-to-motorist men taking care of the injured due to an automobile accident

compariments shaped as shown at C and D surmounted by another piece of rardinard with crossed shits H and some

of the egg while the entire protective arrung ment is quitt capable of absorbing all shot s

This form of crate is said to be available for use in malling eggs without the least danger of breaking them

### Recent Patent Decisions

The appelant, David F. Moore, sued the United States in the Court of the United States in the Court of Lums to recover compensation for the use, without license or lawful right, of a convenient may be been dead of which the from 1993 to 1914 inclusive, his text from 1993 to 1914 inclusive, his text from 1993 to 1914 inclusive, his text of the tool in question, which was adapted to be used as a reeding iron on the decks, sides and bottoms of received where wood caulking is done—that he entared the employment of the Coverment as the employment of the Government as a woodcaulker in a navy yard in March, 1913, and continued therein until July, 1914—that during the month of May, 1914, Mr Moore completed his invention -and that during the hours of his em-ployment by the Government he did not do any work upon his invention, but that do any work upon his invention, but that such work as was performed upon it subsequent to March, 1913, when he satered the government employ, was performed at his home. For the extensive use which the Government had made of the tool be prayed for compensation which had been demanded and refused it is held that where the device was the discovered or invented by a government employee during the time of his simpley-mental properties.

ment or service, applies where he completed his invention during such time, though his work thereon was outside hours of duty, and that hours of duty, and that he cannot recover from the Government dam-ages for the Govern-ments use of his inven-tion—Moore v United States Supreme Court United States

# Barked Knuckles

A set of barked knuckles will teach you more about a wrench than a course in mechanics:

A round shouldered nut you can't get a grip on will add to this knowledge more than a year in a factory.

That's the way you learn that one wrench slips and the other grips—that one nicks its sharp edges under pressure while the other holds true-that one wears out and the other endures. Yes, there is all that difference between such simple things as one wrench and another.

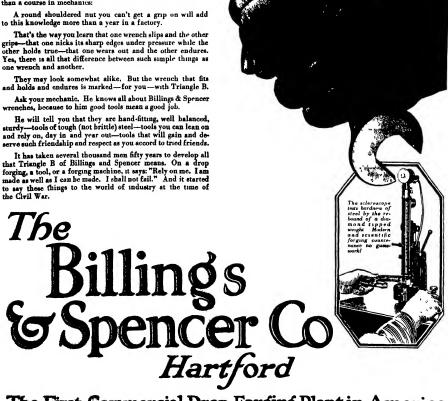

They may look somewhat alike. But the wrench that fits and holds and endures is marked-for you-with Triangle B.

Ask your mechanic. He knows all about Billings & Spencer wrenches, because to him good tools mean a good job.

He will tell you that they are hand-fitting, well balanced, sturdy—tools of tough (not brittle) steel—tools you can lean on and rely on, day in and year out—tools that will gain and deserve such friendship and respect as you accord to tried friends.

It has taken several thousand men fifty years to develop all that Triangle B of Billings and Spencer means. On a drop forging, a tool, or a forging machine, it says: "Rely on me. I am made as well as I can be made. I shall not fail." And it started to say these things to the world of industry at the time of

two a splanes entered in The Daily Mail trans-Atlantic contest while all other entries are land-type planes. But when the experience of the NC boats is taken into consideration one arrives at the conchains that once a manning sea there is hitle hope of again rising. Hence why bother with a seaplane with all its additional weight and head resistance? The averag airplane with its tanks emptied in the emergency will keep affeat for some length f time so that explains the preporderance of land type planes in what would seem to be a hydro-airplane contest

### A Shooting University

(Continued from page 578) it fun to be on their tummies and shoot now

and then at a far off and tmy square of white with a still timier black spot in its Mayhap the rifle lover may be centured over to see why the trap lover thinks it a good time to break a lot of baked mud pies all over the place with a hotgun

the American Irapshooters Association is installing a battery of its traps and is framing up some big shoots right in the iraming up some oig shoots right in the middle of the grounds where the civilian and the flat-foot which is Armyest for the subr and the multia and regular army teams hold forth with their service rifles. For the first time in history, the same grounds are to see a big clay bird and rifle shoot progressing together A c implete range is being built where the

nat hes with the small bore rifle otherwise the himble 22 of the shooting gallery and the small boy are to be conducted. In the right little tight little isle of England when 35 000 000 people make ranges for the military rifle necessarily hard to obtain hundreds of thousands of the Britishe vers f the sport do all their shooting with the little rifle at ranges up to 100 yards Annually a program of matches for these small bore chaps—not schoolboys nor kids but full grown and sober-minded men -is pulled off at Bisley in conjunction with the fill range matches for the military rifle ud a good lot of prizes are hung up

The idea has been transplanted, and the small bore range on the Caldwell grounds to encourage the movement among the rifle shooters and possible rifle shooters of the country, where even now ranges safe for the military rifle are becoming difficult to in l. The chap skilled with the small to hal The chap skilled with the small rifle needs but a day or two with the big military arm to become a skilled war shot The schoolboy will be encouraged to come to (aldwell nor need anxious mothers have views not his shooting up or being shot up by others. The tutelage of the skilled blue-jacket instructors, who made expert shots out of thousands of their kind, is to be available to every comer to the Caldwell Navy rifle range
A hostess house, and a cordial welcom

in shooting and thus make of him one more unit in the fighting strength of the country, is the bases ides of the National Matches as run by the Navy

The three-miles-square Caldwell range is on the Passic River, land reclaimed by the energetic Navy men, and it is reached via Hudson Tubes to Newark, thereo trolley to Caldwell, and bus to the range The range is so wide open to the public that there's not a latch from which to hang the traditional string During the summer

that there s not a latch from which to hang the traditional string During the summer there will be demonstrations by tanks, machine guns, trench mortars and other material, to be announced more definitely through the newspapers

### The French Problem of Recon-struction —IV (Continued from page \$77)

which has been stopped by the war, as m Lingland it is a case of a new building, new machinery a new work force, often new customers. There is nothing with which to start in most cases save a name and plenty of courage As an metance of what is meant, there is, in the very shadow of Rheims ruined cathedral, a little print of niems runice canteria, a stree print shop it employed, perhaps, before the war 40 or 50 people. The propriety could step to the door and see the facede of the cathedral and if he were religiously inclined be inside its portals in 30 seconds; walk. Today there is no roof to the building and if a second story existed there is nothing in the walls to indicate the fact. Whatever was higher than the door has fallen on on the presses. Three r hnotype machines are buried to Three ruined keyboards in brick and stone Every wheel is a mass of rust Any one can have the lot who wants it, an ironmonger wouldn't give a franc for the entire outfit. wouldn't give a franc for the entire outlet.
And this is one of thousands of cases.
That printer must get himself a building,
presses, linotypes, cases, types, paper,
business workmen, before he can begin
to take his place in the industrial establishment again

This central reconstitution group is only advisory in character and can do no trading according to French law So rt has formed a body which can trade, which the formed to body which can trade, which can be the imposeng name of the Comptour Cestral d Achaies Industrials pour les Regions Envahies This body has a singal fund of a couple of hundred thousand dollars to its credit but can get all it needs up to the resources of the parent advisory body, as fast as that body walls. How long it will all take only the future can say There are so many problems all to be tackled at once and I rance is not a country nor are the I rench a people apcountry nor are the Irrich a people ap-to find at once the most efficient and the quickest way. France perhaps more than I ngland elings to the old idea. The French are thrifty to the point of absurdity to the average French mind to throw away. is to waste even if what is thrown away is in itself wasteful to use. Much time is going to be wasted on fruitless attempts to repair and remake what is far better acrapped

But it is not for the onleaker to criticize Indeed after having wandered through these death like regions and som the at solute migation of civilization the complete destruction and the magnitude of the problem one is not t inpted to criticize On a feels indeed that results would conce quicker were ther perhaps less fear of the loss of trade which would come hy admitting foreign products at once. What I rance needs is material tools and trans prainten actum is material tools and trains portation it a keep any of it away with regulation tariff or import duty is apparently a mustak. But hi french know their own business best doubtess, and that your apparently ruined French peasant stort with the properties of the properti keeper manufacturer miner of producer

In the little town of Belleau at the foot of the slope winch rises to Belleau Wood just west of Chateau Thierry has come back one lonely juhabitant Belleau had but a dozen houses and they are now but walls. But the lonely ministrant is not dainted. With hammer and saw he is daunted With hammer and saw hi is industri usly patching a piece of a roof for a piece of a house and he whistles while he works. And that is after all the spirit of france today and the answer to all cratics who find her reconstruction program somewhat small for the task and her program very slow Whatever her nor how they may be criticaed from an American standpoint she has the stout heart and in time and with American machiner, some foreign tredit and the lightheartedness which comes from a beaten Hun and Alsace and Lorrame home onto more she is sure to conquer in the end and heal her wound mend her sars and he over more than the sure to conquer the end and heal her wound mend her sars and her wound mend her wound her wound mend her wound mend her wound stars and be once more what she has for so many centuries taken such pride in being La Belle France

And having seen the back-saw mark of the Hun across this land and the smile ou the face of his victims having listened both to Paris frying out again to sing and the lonely victim in Belleau town whistling at his hopeless task of remaking a home one American observer at least is quite quite willing to lift his hat and cry with all se la Francel

O THE TRADE-

### Some Startling Electrical Phenomena with New Form of Vacuum Tube (Continued from page 679)

nickel there is an increase in resistance only when the nickel is made positive but

not when it is negative

It is known that glass at or near its It is known that glass at or near its melting point becomes a good conductor. This property of becoming strongly con-ductive when heated to a semi-fluid state is probably shared by all other so-called ctries, but it is obvious that it would be absolutely impossible to operate a vacuum tube at such a temperature. In glass will so the tube would collapse at about 425 degrees C. The glass will not however attain red heat until heated to about 600 degrees C. Electroly tie conduction of glass in observed at far lower temperatures than those. In actual operation, the temperatures of this electron pressure of the temperature of this electron. The turel offset both asserts and retards the operation of the detector. It has been found that while conduction is taking place in the glass the products of decommentions in the glass the products of decommention.

found that white conduction is making piaco in the glass the products of decomposition are deposited on the electrodes. The second effect is really part of this third effect, it being probably a deposit or an emission of some of the products of de-

### The Design and Construction of Induction Coils

The wife of the first part of

Scientific American Publishing Co. Woolworth Building New York City

composition at the anode which causes its surface to become non-conductive In the operation of one of these tubes as a detectur some of the products of decomposi the tube and are deposited on the cooler portions of the tube. This action is tion are emitted from the mast walls of This section is of a meherd unture as it would probably aid

might be emitted during the operation

After exhaustive research work Mr

Donle developed the tube to its present forms which are shown in the accompanying illustrations Here we have in each case a hlament surrounded by a controlling elecwithin an evacuated tube the terior walls of the tube being coated with a metally deposit. The state characteristic curve of these two forms shows that there is practically no variation for various tubes. The tube in effect is a vacuum, surrem led by an electrolyte and it is probable that must of its piculiar char ire due in a large moisure te electrolyte whom in the glass walls

The results obtained with these tubes a pasi Rici s india oscillating detectors have be a pute ramarkable according to persus who have used them. As a simple detector the response is reported to be great r than that which is of fained with any of the usual types of vacuum tubes any ctill usual types if vacinum times, but y i detector cselliting on spark signals its promining is externel; grativing the strong holosogids heing many times greater that that given by most tul s in general use

most fill sin general use.

The construction of Mr. Donles tube is sin photy itself. As will be noted from one of the accompanying illustrations it consists of a stem which is shown at A. and with contains a diminutive harpin shiftment while at B the control con-sisting I estuall spiral is placed over and about the filament and connected with the procetn as a hight the filament and then procet in set light the bilament and then I listed of over a hundred found-speaking bound rithe cuttoff in the pulsation of in sufficient pertential elevate it and the local peaking the processor from the cuttoff and the first peaking the processor from an international processor from more realistic porter of frost form gas hefor associably. The second of the processor from the processor fr to f in the plate.

Mr Donk states that the almement of

the filament and control is not at all critical it being only necessary to see to it that the filament is placed as near the eenter of the control as possible. The nter of the control as possible. The postil apparently makes no unnerence in the peration as long as the control doos not tuch the filament. He structural ulvartages of the new tulk are quite obvious when compared with standard tulus lastead of having an area of metal mede the tube of several square continuous there is hardly as many square milli-meters. In order that the tube he held at a fairly constant temperature during operation an outer shell of glass is slipped over the tubes proper when it is comented into its socket. This shell is provided with two small holes near its base which prevent the temperature from becoming excessive With this shell removed the operation is quite satisfactory if there is no The shell protects the tube from draughts and mechanical injury

The uniform operation of the Donle tubes is most remarkable. It was at first expected that commercial variations in the glass thickness and so on, would materially affect the operation. Such, however, is not affect the operation Such, however, is not the case and made under ordinary conthe case and made under ordinary con-ditions they run entirely uniform, so much so in fact, that tubes may be inter-changed in any circuit without the ne-cessity of readjustment. In short, the tube described possesses not only certain superior electrical characteristics, but 19 readily and heaply produced in any quantity.

# A Successful Type of Anti-Noise Trans-mitter and Loud-Speaking Telephone

(Constitued from page 579)

relation to the disphragm, in order to relation to the disphragm, in order to prevent it from being held horisontally at any time. Other transmitters, when used by airmen, are apt to be held horisontally when looking over the side of the mirplane, with the result that the carbon granules fall away from the front member of the button and the transmitter becomes in-onerative. With the button at an angle, operative however, it is impossible to bring it into the horizontal position unintentionally The transmitter is held in a perforated casing which permits all sounds to reach the front and back of the diaphragm, while a push button permits the transmitter

to be cut into circuit when desired Aside from the anti-noise transmittee which it is interesting to note, is employed on the Navy NC planes and other multiple-engued machines the same inventors have developed a loud-speaking telephone of novel design instead of the usual heavy disphragin attracted by a pair of electro-magnets they have made use of a pair of powerful electromagnets with right p le-meces between which vibrates a coil the coil is fastened to the diaphragin by means of a wire and moves up and down across the lim's of the magnetic flux. The electromagnets are connected in circuit with a powerful storage battery while the telephone current is passed through the fine winding of the coil

### A Stethoscope for the Earth

(C mithe aid fr ne page 581)

Mining engineers believe the geophone will be useful in preventing prejdents from explosions when breaking through this yet remains to be tested but it is certain within several hundred feet it prefectly possible to destinguish the dif-ference between tumping a charge using a pick bitting with a mallet or a sledge or almost an other sound. It is difficult to describe this ability of the bittle suith stethoscope to make sounds recognizable but it is remarked by all who use the instrument for the first time

Observations were made recently of a mine his burning from twenty to forty feet below the surface. A low rumbling noise could be heard as if air were being drawn in long crevices and accasionally sounds could be heard from the snapping and failing of paces of coal or rock well as can be determined the fire area was accurately located but owing to the fact that the are could not be appre from the moude the data was not checked absolutely It is interesting to note that similar sounds were heard from only one point on the meide of the mine and that that point was the one nearest the area alocated on the surface

It has been found also by the Bureau of Mines engineers that the instruments can be employed quite advantageously in locating knocks in automobile valves and cylinders For this purpose it is well to that can be easily inserted in and around the machinery by this manner not only can a troublesome cylinder be located but the trouble area in the cylinder can also

After the maestigative work has been completed a course of metruction in the use of the geophones will be developed and recommendations will be made as to what procedure it will be best for a resourer to as what had best be done by an entombed mmer

### The Current Supplement

Till principle or hypothesis of relativity which has been under discussion for 25 years or more is now being developed into a theory of broad bearings. Those recent developments make it all the more more tant that we stop here to review both and new hypotheses in this field, and our readers will be glad to have before them the clear discussion on Physical Relativity which the Scientific American Superi MENT, No 2265 for May 31st 1919 offers Another interesting survey and review is presented by the article discuss review is presented by the article discussing The Influence of Astronomy on Human Thought, wherein it is brought out how important astronomical research has been in shaping our ideas of space and of time during the history of human thought Our iron-makers and acid manufacturers will be more interested in the article, Acidresisting fron, which reviews human efforts resuming 1 ros, which reviews auman entoris to produce a resistant iron which shall take the place of the expensive rarer metals possessing this property. The steady increase in demand for economical fuels will attract attention to the work of the

Circumstances may compel you to accept a "readymade" building instead of one designed to fit your needs But that does not compel you to accept substitute sash as well! Your factory does not shut down when it rains why should you shut down the air supply by using monitor sash which must be closed with every shower?

# DOMO CONTINUOUS SASH

can stay open rain or shine, without danger of water damaging goods or machinery It is built expressly for weatherproof ventilation and was the pioneer sash of its type.

By specifying it when you order the building, you get:

Greatest width and ease of opening

Greatest strength and glass protection,

Greatest resistance to corrosion. Fewest operating stations on long lines

You needn't delay construction a day! We furnish Pond Continuous Sash from warehouse stock in Philadelphia Cleve

The cut of the suit may have to be ready made but you can choose the material you really want!

## STEEL FURNITURE

An expert, practical designer required by a manufacturer of Steel Furniture in England Work-shop and drawing office experience essential

Must be able to prepare detailed drawings and specify quantities and direct all operations from raw material to highly finished product Other specialists experienced in this class of work, please also apply

Applications giving full details to be sent to the Mix Adv Agency, 381 Fourth Avenue, New York

Applications received immediately will secure a personal interview in New York

### Williams' Superior **Drop-Forgings**

To the manufacturer requiring Drop-Forgings that will measure up to the high standard of his product and assure him of absolute dependability, what better evidence of Williams Superior quality can be submitted than the following

The Annual

# Roll Call

# of WHITE TRUCK FLEETS

ACCORDING to its annual custom, The White Company is now publishing its Roll Call of fleet installations (ten trucks or more) in national magazines and metropolitan newspapers.

Year after year this Roll Call grows. It is something more than a list of well-known concerns owning ten or more White Trucks. It represents a yearly progress in added trucks per owner—the most extensive growth of individual fleets ever published by a truck maker.

The rate of growth of the installations which comprise ten trucks or more is shown in the following summary for each year:

1910...54 1912...495 1914 .1704 1916...5147 1911...194 1918...1001 1915...2601 1917 .7436 TODAY 9227

There are now 2,774 White fleets in active service, totaling 33,139 trucks, exclusive of all single truck installations.

A copy of the 1919 Roll Call will be sent to anyone interested upon request

# Cheaper Transportation Instead of Cheaper Cars

Corporations require cars for the use of executives They can afford to buy to the best advantage They choose Packards for definite business considerations longer life and higher second-hand value; ease of handling, lower maintenance cost, reliability, economy and safety, and because the Packard is professional through and through

HFRE are a good many men in a rust as to motoring possibilities

بالبارين البارين لياليان ليالها والمناسات المناسات المناسات المناسات المناسات المناسات المناسات المناسات المناسات

They don t know what they are missing or what it is costing them to use a compromise car

They never will know until they get their hands on the steering wheel of a Packard Twin Six, feel its sensitive response its pick up and getaway its pep and go its case of control its absolute smoothness and accuracy

The Twin Six is a remarkable car to handle in traffic. It is a revelation to the man who now grands and jerks along in congested city streets.

It can be throttled down on high gear as low as two miles an hour and most of its work is done on high From two miles an hour it will, in a few blocks pull up to better than a mile a minute But with all its speed and power it is not a racing machine it has none of the limitations of the car built for fast travel over short distance and it doesn't make you pay for power you don't use

One prominent industrial men says The Pankard has added at least three hours to my potential business day

Another says With the Packard I can live 29 miles farther to the country

Another says I can cover more ground and keep to schedule by my watch These days the Peakerd is more reliable than thursune.

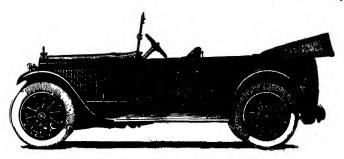

Another The Peckard is one shining example of a meter out

Fhere is a new science of transportation—that of motor-vehicle performance, maintenance and cost. It has to do with your car and its duty, however limited its use

The Packard people are transportation experts; they have more to tell you on this subject then any other organization in the world. You can ask them to discuss your car problem without obligation. It is to your interest and profit to do so.

#### Lessons of the Trans-Atlantic Flight

NI wook as a long lapse undeed in reporting the new of the trans Atlantic fight. In last, week a seaso we were last uting the loss of two brave meal hawler and freew who see not from New-foundand in their unalge-engined Sopwith biplane and who were not heard from for several days, thus giving every reason to bulieve that they had mot with death somewhere in the tractices Atlantic. But before the last sause could even reach nutrendeer news come from Section 1 to the second of the second o

After all the Sopsith machine performed well according to Hawker a story. It covered well over half the datance and was in the air about 13 lours before it was forced to come down because of eagust trouble It appears that the (trulation system became choiced and the temperature of the water row to the busing point. Still despite the great heat of the evhaders the eight continuous despitements of the evhaders the men algebraic on the sater in the path of the 'Mary, which roked them in.

Somehow or other the Sopwith a fight even if unsuccessful har raised the stuck of the ample sugmed plans to par or better. For it is now generally believed by dying men that Hawker and Criv's would have mind, the crossing had it not been for the dougning of the circulation system. Bo those why have been lagaring on using single-england planes are again in high planes and draum-

Whetive may happen in the trains Atlantic flight contrat between now and the next few weeks the fact remains that the is little of someweard whe in any of the attempts. It is necessful crossing of our Nayry's NeX eliberates better than may other attempt the magnitude of the difficulties. With moneyous warships stretched out along the curse of the X-machines and with the very finest ejaponent possible the Nayry attempt has doed by i that the chances at making the flight are in the p-p-ation of m- and of three. First the Nayry attempt has been set in adversible do adverse weather conditions. In the observable of the matter. Overeswith an exposure is the Atlantic Orean there are few days throughout the view when weather conditions are ideal for a flight over 1000 index. Adverse weather must always be considered in any trains Atlantia attantic.

As for the machines, the land type of plane is strange as it may seen the best for the attempt. In fact of all the machines entered in the londer blondy Most content only two are seeplates up till the present writing. As the constructors have viewed it and as the experiments of the Nr I and Nr S have proved a machine no matter how sturchly built at may be has little chance of resuming the fluctuation of the Nr I are the fluctuation of the force of the fluctuation o

So it comes right down to a matter of using a land plane, which is lighter and makes a greater speed than a seaplant of quivalent expandity and running the chance of getting across without coming down. In a word, the trans Atlanti flight must be no big jump

## The Naughtiness of Nations

ARLCENTLY published report of the Census Burrau acts forth state rather curious figures as regards the number of prison commitments and of juvenile delanquests and an ing the the foreign-born white population of the United States.

The has a headed by Meve — with 2 1 par cent, flaured on the Measura population huming in the United Nixtas Next in order come the Irods with 2 per cent and the Stotch with 12 per cent. Nustries follows with 0 82 per cent. Figliand and Wake-sh w 0.77 per cent. Fingland and Wake-sh w 0.77 per cent. Fingland with 0 11 per cent. Then we colding the list consequence of the per cent. The second of the Measura with 0.81 per cent. It also use the 1 per cent. It also use the 1 per cent. It also use of the 1 per cent. It also use of the 1 per cent. It also use of the 1 per cent. It also use a mong the shift of contributors, giving 0.59 per cent.

There are the figures 11 v bring some surprises and also some extreme contrasts. Thus the Irish were committed about five time, or frequently as the Germans and the Scotch twice her fit in as the Itahans.

What construction is to be laid upon these facts?
What conclusions shall we draw from them?

The only conclusion as which in the feels reasonably sure is that the figures can it be used as a measure of oil gift by the feel of a measure of oil gift by the feel of a measure of oil gift by the feel of the

In any case numerous fit it is uter and influence the statistical figures which is if rith only the resultant of many forces acting together. Only a complete analysis showing all the contributing a risk wind enable us to construe intelligently the sit isni il late.

In the first place the nature of the offense must be taken into consideration. It has for metance three-fourths of the commitments in one the interest of the commitments in one the interest of the loss serious offense. I thinke miss and district that the same head the Italians who showed up favorably in the retural contributed loss than a third of all their offense. On the other hand the proportion of commitments for sealing was larger among Italian offenders than for incommitments for sealing was presented by the contribution of the contri

A factor which also product by hocal maring on the statestal about a tile bottomit in of each mation among the rural and the of us population. For instances of the Irade-born N17 present were living in urban communities, while the excrepaoning factor for Germans was 69 7 per cent on for introce of Domnark N3. But on the other hand the Mexense who have the highest proportion of communities have also the smallest proportion buying firetties and Russan for whom the percentage living in edities in Russan for whom the percentage living in edities in Russan for whom the percentage living in edities in Russan for whom the

# Another Field for Patent Relief

I'll granting of a patent is on both adoe a close cue of an agreement with consideration. In consediration of his having created azmething nw the Giovernment grants the inventor exclusive rights over the thing creat of in consideration of this grant the inventor agrees that his rights shall hold for a limited period sides which his unvention shall be thrown open to the free use of all. To make this limitation offset who, his unvention shall be thrown open to the free use of all. To make this limitation offset who, he was a full disclosure of his invention of the present of the present of the present of the second or the seco

Now the Government requires no protection against the inventor for the latter has no power to oppress the

public. The Covernment, so the other hand, has whitey power to oppose to inventor to can, if is will, seen abrogate the whole patent system and confineds all inventions that in spite of urging from certain pursues it does not do this is simply because a majority recognitism and a course to be uriginal and, in the long run, unpostable. But ma a thousand other ways the Government through its legislative and administrative bodies, has power to harnes the inventor. Moreover, the state does not of stell, possees the will not do do this. Procedure which unvolve the dealing out of injustice arms autimative sub or accordantly, they cannot no be set saide but can be negatived only after a great deal of effort be of behoves us to watch with the utmost eart the progress of patent law and patent procedure,

Now the faventor wants to hold be invention under he central as long as he can, the public wants the right to use it freely as soon as possible. As the best compromise hetween these conflicting interests it is decread that I? varies as that life of a patient is just long enough to enable the inventor to build up a demand and a means of supply and their to enjoy a period of profitable monopoly. This is recognised as a fair arrangement for all concerned.

heveral decades ago a certain inventor inventor an machine for cutting venera 10 times as thin as they had over before been cut. He spent a number of years in developing this machine to the point where a patent was in order, and several more in establishing it in the market. At this psychological moment solid furniture came is and within an increability brief interval there were no veneers being made. The veneer came back, but not until after the expiration of this patent.

In the case cited the inventor was merely unfortunate What would have been his state of much, however, if the Government, at the moment when his investment of time and money in his patient was at a maximum had (in good faith) sought to develop the lumber industry by a law forbidding the manufesture of any save send furnitura? Would he not have had a grevance? Would he have been in any way isseaned by the knowledge that the law was intended to serve a good out?

Right now there is a large hody of American inventors in much the position here suggested. During the progress of the war materials had to be diverted from non-secrital uses to essential industries. This was eminently right and proper our only bisaness, last year, was to beat the common enemy. But consider the feelings of a man holding, a paint on newdl asy fire-seepase, or a superior grade of fancy paper or a mechanical toy of metal, a prietting reall under way toward profitsable reploitation when the war rame along and cut off his supply of raw materials by gow rement defect or even made it temporarily tilesal to menufacture has article under the mediance of the median of the median profits of the median profits of the profits of the median profits of the me

This man will feel much worse than the fellow who has been put out of business by the laws of supply and demand or by pure luck He will feel that the Government has robbed him of two years of the term during which it had agreed to let him enjoy the exclusive rights in his invention. He does not claim that this should not have been done, he realizes that it had to be done But he does claim that reparation is possible, in a manuer so simple and so lacking in cost or injury to anybody else, that there is no excuse for not making it. Give his back his two years, he asks, add them to the term of his patent, so that it will expire in 1925 instead of 1923 He wants no recompense for the general disruption of his business, for this was a hazard of war that all suffeced in common But he does think that when the Government found it necessary practically to suspend the opera tion of his patent for two years, the least that sould be done for him would be to give him back those two years

There is a large number of patents in the building trades as well as in a wide variety of non-ceneratial industries employing essential materials, which were thus readered integerative during our praticipation is the large fight. Much has been said about releving patenties of the defaults improsed upon them by the war. We believe that the group we have mentioned in quite as deserving of consideration It is not a question of extending all patents luddsorminisately for two years, but simply those whose holders one show that they large singlened the loss outlined. It seems to us that the aboute singulated the contract of the contract

Amether Expedition to the Mount Katmal Ragion of Alaska, under the leadership of Prof 1 orags has been sent north by the National Seographic Society, and was reported to have reached Kulinki Island the latter part of April. The party includes cleamates a pertographer a ro logest a bottomet and representatives of other strance and also motion proture photographers.

Froposed Airpians hxplorations in the Antaratic Flans are on foot in England for another antarctic expedition which is expected t start in June 1930. It is t he led by I L Cope, who we as member of the last blacklation expedition. The party is true south in the form Nova the wessel used in words fast expedition and it is planned to make extra experimentors of the interior of Antarolles by sarpiani, including a flight to the south pole.

Gravity Observations in Canada A raport from the Domano Deservatory, Uthers state that 4 andhas now a line of gravity status or right at one the continent, sowering more longited that is to recred by another serve of estations on the Am rean continent. These in conjunction with the gravity observations taken in other parts of the world will furnish valuable data toward the determination of the fourir of the earth MF WB Bown, of the UB & Gast Purvu is now combusing the Canadian observations with those of the I not state, for use in a new publication on this subject

The British Dally Weather Report sessed by the Metsorclogical Office in Lendon has recently undergone a sotable corposation, reflecting the great increases in the work contride on by England's Clerk of the Weather in response to the world demands that areas during the war Stone Agril Let the sport has been sested in three cognition sendons, vir. a British for too, an International Restion and an Upper Air Supplement All three sections contain weather maps In the Upper Air Supplement there are negar of the British Isles showing the winds at various levels from the surface up to 16 000 feet, for afternoon, weather making and morang. This is primarily for the information of aeronant but will prove of great interest to all meteorologies.

More Information About Balsa Wood -An article on the remarkably light wood known as bales, now extensively used in making his rafts, certain parts of sirplanes, etc., and also valuable on account of its heat-American story and the second story and the second story installed in the Second story and th W Rowies of Cornell University who was mui to Central America last year by a New 1 irk company to study balsa in its native environment Professor Rowles has just published in the Journal of the Washington radamy of Sciences an article on the botameal characters of the wood. The balas tree belongs to the genus Ochroma Formerly only two species were recognized the one which was the source of the wood imperied to this country being known as Oct miligopus Pr fusion Rowles a investigations moreas: the number of known species to nine. He states that biles is usually a second growth tree, appearing promptly and abundantly where clearings have been made by natural or human agencies grows with astonishing speed fron attaining a height of 60 feet or more in five or my vears. It is doubtful whether any other tree grows so ripidly. In its natu il state the wood is very peruhable decaying with u parently the same rapidity as a cotton fabric 11 balls wood of commerce m made 1 crahle and waterprof by a special treatment invented by R A Mart 1 tropical America this tree bear many names bes less bales which is inspely a Spacesh word for "rai in allusion to the fact that rafts of this wood are used in alludon to the fast that rafts of this wood are used for transportation surpasses on the Nouth American rivers. In Micharquis the tree is called 'gatille, in Customaia, "indica" an the wort count, "mobio and "inna" on the seat count, in Cube, "lamille in Jamanes," evertwood!" and down tree," on as the Jamanesa negrous frive it, simply "dism" Heles proved its middly in this way, when it was not only used actionarily for lifewish and Info-boxing across the Neuth Comp. 18 to 
# Industrial Efficiency

Scrap from and Steel of Panama—According to a statement made by the general purchange officer of the Panama ( and there is on hand on the International thousand tune of strap ron and stiel available for the positron and the monthly accumulation to approximately 500 tens. It is realised that there is but a limit of small for sears prem and otted in the United St tes therefore, the Purchange Lynatics it of the Panamacanal at Washington does a top it in tach with export uncersis that would be not cested in securing supplies for adjuncted to I propie

Scaffolds—During the piet war there have been tripated a number of accinited when have coursed as a created of scaffolds by aking, illapsing or falling. While these are itself are not frequent they are as a rule of a string nature to metruction of acaffolds of extraction and the scaffold of extractions of the scaffold and the scaffold are string a sentent significant control of acaffolds are constructed on that they will safely stand the load which they are expected to bear its away important that no constructing acaffolds nothing but sound high-grade material be used, and that the work he arrafully and throughly done

British Rules for Employment -The exigences of war made it necessary in main trades and occupation to introduce employees who under the pre war rules, practice or custom obtaining in the trade could not have performed the class of work on what they were placed hear men are called dilutees In order to facilitate the return to pre-war practices in this respect the Minister of I abor has laid down the following general principles for the guidance of employers in dealing with question of priority of employment and discharge as b skilled men and dilutess (1) Where two workers are employed in the same department and on the same class of work, one a skilled man and the other a dilutes, and one must be discharged the dilutes should go (2) If s skilled man is unemployed (whether as result of discharge from a factory or as a result of demobile and presents himself for employment at a factory when dilutees are amployed in the trade in which the applicant m skilled, he is entitled to claim engagement and should not be refused employment at his trade on the groun that there are no yas ans see and that his engagement would involve the discharge of a diluter (3) Where in a single establishment there is more than one department in which workers engaged on the same class of work are employed, and it is necessary to discharge workers en-gaged on that class of work, no skilled man abould be discharged while any dilutees working on that class of work in the same or any other department are retained

I imitations of Women Workers -We have often he ard it said that women are not successful at work where micrometric measurements play an important part, or where great exactitude of some other kind is demanded We are of the opinion, however that this is a mistake, and that such failures as may have occurred in this direction have been due to improper selection of the workers there is great diversity among men with respect to esparaty for precision work, and differences stell more marked may perlesps coust among women, but British experience has shown that excellent results may be had from women even along these lines, if the proldent is fairly and intelligently faced. In Great Britain it has been found that even in connection with operations requiring a remarkable degree of mechanical precision specially-selected women after a comparatively short training course, have shown themselves able to pirform the work just as well as men who have had equal experience and matruction It cannot be dened, The Tracker Standard continues that women are inferior to men, on the whole where strength and muscular endurance are important clements. The average won is not as tall as the average man our has she so long a reach These two factors affect her lifting power adversely, and they also diminish her radius of activity that is the distance at which she can still do things effectively without moving boddy from her station Moreover, if a man and a woman have the same height, weight, and general physical development the man can almost invariably exert greater strength, and maintain a rular strain for a longer time, than the woman, and if greater reach, lifting power, strength or onduranie enters in the cycle as a determining factor the man will prove the larger producer

# A United States Port in France

American Accomplishment in France a Model for Needed Reconstruction Work

By C. H. (laudy

Special Correspondent of the Scientific American in France

In so only natural that looking it the big job America has done in France the American people should see only the but things and the I rais not at all or as a confused mass rather than as detined points. This was taken with at we have transported and manufactually distant two million men in France but of the Property of the American Confession of the Transportation, that manufactuation of that transportation, that manufactuation of the Transportation, the Transportation of the Tr

rather vagues

part of the problem. There must be applied materials
ruchat telegraph and the problem to the problem of the proble Yet some one had to think of the details in advance

and inefficient method of lighterage from ship to shore or it means don't docks of course, but by no means enough docks to take, care of her own wants and those of America too. France had to be for from without and she had to receive the troops from England and she had to receive the troops from England and she had to receive the troops from England and she had to receive the troop from England and she had to receive the troops from England and she had to receive the top from the cold to add America and and maintain her troops. Prance could not stretch one dock to berth two ships Morsover with all rappet, to French methods America has her own way of dong things and it is emphatically not the court method. See the United States, through its engine cap proceeded

doing things and it is emphatically not thorout immediate. But into the three three three three three three three to carriage it over desking fashine in Praces By no means at it over desking fashine in Praces By no means and it of 80 ship borths averaging 410 feet in length three not all Assertions but Many were sequented from the French But all felt the influence of American labor away devices and had some American sarpe handling devices untialled Otherwise, the tonnage of 40,000 daily, noneasary for our Army could never have been landed fast enough.

At one time or another America has used versatically

daily, necessary for our Army could never have been landed fast congst.

At one time or another America has used practically every port in France. We constructed new facilities or took over berths at Le Havve Rouse Obserbourg, Granule, 8t Maio, Rest, Lorente, 18t Nasare, Kantes Monton, Donges, Les Sables, d Olones, Le Philice, La Rochella, Rochelort, Faulino, Blaye, Toronte Basson, Burnell Bayronn, Cett. Marzellier and Research Research and Company of the Company of

at their best. It is literally a slice of American efficiency laid down in France, and, it may be said, to the wonder of every French engineer who has seen the work grow from nothing to perfection an an incredibly short time, and in spite of difficulties with might well have daunted one. Therefore have described the same france for

and in spite of difficultses which might well have datased even United States Army Empire :

The work at American Rescains which is on the east bank of the Garones rave about three miles from Bordestix, was begun in the tises immure of 1917. It should be understood that the sonth mpilated propose was not only a dock, with better in ten vessels but molecule everything that makes a do k into a port—a powder.

Fire fighting equipment on American decks

dook, recoving yards, departure yards, warehouses, water supply, sweenes, railroad tacks cargo handling devices, everything necessary to get the freight off the vessels, stere and soft at, and ship it away into France

vessels, sters and cort st, and shap it away into France
From the outset the work was been by the natural
difficulties inherent in trying to construct a huge segneering work 5,000 nailes from hims. Material was
difficult to get free America and must that did come
through was, consistents; in the case of heavy timber
in such poor conditions as to be unavailable for us
France had, or thought she had no timber available
but the first forestipy operations undivision in France

by American forestry troops growed the centerary, and, when the transportestion difficulties were reversely, and, when the transportestion difficulties were reversely, and, heavy piling and timbures begins to be swrighted in sufficient quantities.

The site of American Beantes was compiled by barready used by Indo-Yames sumplyed. In a pervise well-and the state of American Beantes was compiled by barready used by Indo-Yames sumplyed. New berths in French port at Ba

which are of the double slip type. The receiving yard, a quarter of a mile southeast of the dook has mx and a half miles of track and 34 switches two of which are double slip At the completion of the project there were but two beavy gantries installed, the dock not being strong enough to support the immense wheel load, required should the cargo-handling devices all be of the origi

enough the carge-handling devrees all he of the originally planned character. But conditions had now changed and for the hetter, the material necessary to make the dock strong enough for these most efficient of cargo-handling devices was now avail sable. A board appointed to consider the matter west into it very exhaustively and finally decided upon the strongthening of the dock and in September of last very 3,00 additional piece and half a million feet of lumber were added to the dock so that the entire 10 bettle south of equipped with the entire 10 bettle south of the complete with the entire 10 bettle south of the control to the state of 46 of these big cargo-handling devices, or four to a slup Some of them are five and some 10 tons leapanetly but it was rare indeed that any of them could work to capacity, maximuch as most freight is bulky rather than heavy.

The completion of the installation of the heavy geatifies gave the Bassan project.

he completion of the imministration of the heavy gautries gave the Bassans project an unloading capacity of 12,500 tons per day or enough to care, alone, for an arm of 500,000 men Indeed, the unloading capacity of the transe exceeded the capacity

capacity of the craims exceeded the expective of the available forces to carry off the freight as it was lifted from the vessels, and, as one of the pictures shows, freight congestion on the doclifited has more than once been the measure of speed of unlocating

It is difficult to convey a picture even with the sid of

It is aimout to convey a picture were with use and it bes photographs, of the fewerish activity of this entirely efficient plant in action. In no other port in France is there the same capacity to unload and cortainly, without it, the army must have suffered for want of the average of 50 pounds per day per man which is necessary to keep a fighting lorce in France supplied with food, clothing

ammunition, arms, squipment and miscellaneous supplies. The reader will not consider the picture of freight congestion as typical of the operations at Bassans. The sunken railroad tracks the storage area and the switching arrangements are such that save upon exceptional days the dock was kept clear of freight even with the forty gantries working all at oses. Having been most carefully planned, there was little if any delay in getting the unloaded freight into sither trucks or cars and if the

Lighters at work at American Bassans

O 8 was able to function so that the army first of of-S O S was able to functions so that the army first of of-cases and now of occupation, could be fed and clothed and supplied, it was largely if not entirely because of the efficiency of this since of American means and methods laid down in a port which, famous the world over as a port, had nevertheless, up to that time, seen orthing to compars in speed with the American method of freight has diling

Too much attention must not be given American (Continued on page 613)

# Killing Weeds with Live Steam

A Sa means of killing weed seeds fungous growths and plan of stribung the ground with live steam before the seeds are sown. To have or sellings are very sensitive and especially susceptible to root tot. The fungus attacks the roots of the seedings and subsequently senously affects the vitality of the plant. For some years surface burning or building a tire on top of the

prospective beds was practiced in various sections. This was not entirely successful how ver and the new plan of killing fun gous growths weeds and insects by steam has been carried out

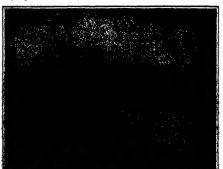

599

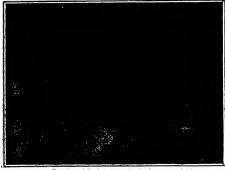

Experts of the United States Department of Agriculture have estimated that the pays for the cost of starilization. Not only that but the new plan has also been suggested for use with other scedling bods This plan in short kills the words before they cin come up

Steam sterilization of the seed bads simply means that a pertuble boiler is set up near where the work is to be carried on while an inverted pan of metal or we l is placed over the beds after they have been prepared all ready for seeding Steam under pressure is turned on for half au hour which accomphishes the work. In some places farmers are buying boilers for their own use requiring them or owning

em in common with other farmers ordinary threshing machine boiler or in fact any boiler

ordinary threshing machine boiltr of in fact any boiler of 20 horse-power or more—depending somewhat on the saze of the steaming pan—is suitable. It is essential that there be enough pressure to force atcam into the soil. A pan having an area of about 72 square feet is regarded as about the right less is Wooden pans are chespor than those of galvansed iron. The pan simply consists of a wooled frame with boards nailed across the bottom and of course very stringly reinforced so as to (Continued on page 612)

and educate with live steam, such an example of its work. The plot at left of partition inhowing heavy growth of woods was not trisited; that at right was

# Much Wheat-Little Corn?

# Close Relations of the Two, and How the Size of the Corn Crop Affects the Price of Meat

By the Washington Correspondent of the SCIENTIFIC AMERICAN

WHIN the United States Government undertook V to feed the world with wheat its most effective step was the provision of a guaranteed price for the wheat \$2.26 Chicago

When the armistic came along and there was the less ecessity for wheat, the price had still to stan I because necessity (or wheat, the price had still to stan I because it was a covariant between government and individual And it's human to take advantage of apportunities as darmers all over the land planted what and vit more wheat and then still more wheat in the comforting saurance of a high price regardless of the sun of the trop or economic conditions of demand. There is only so much land. If all of it were planted in

wheat obviously there would be none left for corn o cotton or tobacco or any other of the hig crops. Of course the character of the land and the chimate have an automatic check on over-planting. Wheat won t grow on all farm land, nor is the yield big enough in all chimates to make it worth while even at \$2.26 per bushel. But there is much corn land on which wheat might be grown, at least so think many who are timid about the p most, and it has been a matter of some moment and a good deal of wonder to many who study food economics whether or not the record wheat planting of this last winter and this spring may not so reduce the corn acre age and yield, that meat (which depends largely on corn for its growth) will sky so high in price that no one will be able to buy it save motion picture actresses and

millionairee

Nobody really knows anything about it, yet, because
no statistics have been gathered about the corr planting
this year. But there are certain straw which are indieations and they are, luckily for our peace of mind,

very comforting straws
It should first be explained to the non-agricultrual when that winter wheat is normally about two-thirds of the total wheat erop, and that there are two ests of statistics about it while only one is usually made for spring wheat Winter wheat may be, often is, winterkilled. So the acreage planted is one thing, and the acreage harvested another. Corn and spring wheat are usually harvested in about the same amount in which they are planted

they are planted Department of Agriculture statistics for 1919 show that of the 49,261 000 acros planted in winter wheat, 48 933 000 will probably be harvosted This is the greatest areage of wheat over harvested in this country. greatest at reage of wheat ever harvested in this country the harverted figures for 1918 are 18 704 000, for 1917, 27 457 000 and for 1916, 34 709 000 the great difference between 1916 and 1917 being caused by a severe winter-killing In 1915 we harvested 11 408 000 acres and in killing In 1915 we h

Now look at the eora figures In 1918, 107 404,000 arres, in 1917, 116,730,000 arres the greatest corn acreage over reaped in this country. It was great because there was so much winter-killing of wheat and winter-killing wheat fields were pi we'd under and spring-planted in corn. But the figure for years before that are almost unvarying In millions they run from 1910 to 1916 in the amounts of 104 105 107, 105, 103 and 106 milions acres regardless of the much greater fluctuations in the wheat areas harvested. Now compare with the wheat areas planted (remember the wheat figures here

wness areas pianted (remember the wheat figures here given are winter wheat figures old total figures). Beginning in 1914 and running to 1919 the figures, in millions, are 37, 42, 59, 40, 42. 40. In 1914 we planted 37 millions acres wheat and millions. Corn; came from 103 millions acres in 1918 we planted 42 millions wheat, reapped 36 millions wheat, and 107 millions acres in 1918 we planted 42 millions wheat, reapped 36 millions wheat, and 107 millions acres in 1918 wheat and 1918 wheat and 1918 wheat are shown as the same of the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres wheat and 1918 wheat are shown as the same acres w wheat, and 107 millions corn is there anything in these statistics which would prove that an unusually wheat crop meant an unusually small corn crop?

But there are other straws besides the rather unsatisfactory ones of judging the future by the figures of the past. There are certain factors which seem apt to increase the planting of corn this year. One of these is the campaign in the south squiist planting too much cotton. There was a large carry over of cotton last year. Hence the educational campaign designed to divert some acreage from cotton to other staples—and none grow better in the south that sorn, its other great erop Corn is rather late this year because of the beakward syring and so reports of core probabilities are slow in coming in But in at least three states, Michigan, South Dakots, and Arkauses it is known that the corn

South Dakota, and Afkansas it is known that the corn arrange has been increased over last year. Of the total corn error, 75 per cent is used as fodder and probably 60 per cent or more is used for food for meat animals (as distinct from horses, mules and over the corn statistics are so interesting to those to whom the price of meat an object. If too little corn, they argue, there will be

higher prices of meat

But here comes in a funny little kind of food eco But here comes in a funny little kind of food economies of The prospects of a bumper ergo of fodder usually increases the price of meat animals at the time of the prospect of a pone ergo decreases the price of food animals at the time of the prospect. If it was to be known that corn were to be vary soarce the price of longs, for instance, would decline. The season is amplie amough 14 m and has 100 hoggs and thinks he can t get corn to fatten them, he offers them for male so the other fellow and to the voryring. So do all the other fellow and to the voryring. So do all the other help with a season that the contract of the corn was a season of the contract of the hog owners They giut the market with haif-ded hogs. When the supply a greater than the demand, prices fall Par course, if the owner knows he as to have plently of corn, which means cheap occup, he will beld has hogs and fatten them later, knowing he can get more for cornstatened hogs than for the sorm and the lean hogs, uncombined. So that prices rise because hog raisers

are holding hogs
The reaction is equal The high price to cheaper price when the hogs are fattened and sold, and a cheape from when the hogs are fattened and sold, and a cheap hog market today due to prospects of lack of corn, means a high-priced hog next winter There is no apparent falling off in the price of bogs now.

# American "Mystery" Ships

# Cleverly Protected Decoys Prepared for the Destruction of U-Boats on This Side of the Atlantic By Eric A. Dime

DURING the last year of the war stories about the British "mystery" ships percolated through the news channels and gave the reading public a slight idea of the means employed by largiand in combaining the German submarine warfar haturally very little was corman submarine warrare Acturary very fittle was reported about the construction of these ships. All we knew about them, was that they were merely decays dengand to lure the prowling subs into a trap. The vessels looked like ordinary slow-going freighters but when the U-boats came within a reasonable range of the mystery ships hatches would suddenly open and behind them guns would bark at the enemy

n the United States declared war on Germany. naval authorities realised that American shipping along America a shores might be menaced by the Hun's ses prowlers. And surely enough that is just what happened Across the Atlantic came the wasps of the sea and they dealt their death stings to several of our merchant vessels

Of course fighting craft from our navy were constantly on guard along the coast and waiships and U-beat chasers were supplemented by two other vessels that looked for all the world like ordinary cargo steamers carrying provisions from our shores to the ports of Europe The two innocent-looking vessels were the patrolling our waters from the rock-ribbed coast of Maine to the Florida Keys

Our Navy Department knew that the British decoy ships had experienced some success in combating the U-boat menace, and as soon as we entered the war it was deemed advisable to employ the same methods in local waters. Now since the German navy has been local waters. Now since the German navy has been nicely tucked away at Scapa Flow where it can do no harm and since German militarism has been knocked off its pedestal of power it is possible to lift the veil of secrecy, which kept the public in general in the dark on named matters while we were fighting the Huns

The American inputery ship was designed as a decoy ship for combating the submarine warfare, by Warren S.

Fisher, recently attached to the Naval Intelligence Bureau and his plans were submitted to the Navy Board three weeks after we declared war on Germany Mr Tisher's decoy represented new ideas superior to the British decoys in the fact that instantaneous action of gunnery was assured and greater protection was given the ship in course and action

The guns on the British ships were concealed by false structures built about them and these structures neces sitated loss of time in folding preparatory to action and that incurred in securing the image and proper sight The American designed system obviated this loss of time by the novel method of having the guns countersunk in pits that would allow them to be concealed just above deck behind false panels. In front of the muzzles of the guns were rubber disphragms flush with the sides of the ip and painted the same coir is the outside of the ship

On top of the guns were sights extending beyond the parrels and slung in the rubber diaphragins. This rusde it possible for the gunner to sumg and range his gun im-mediately upon observing a submarine. Thus prepared the decay vessel could move along leasurely until the 1-boat came within a satisfactory range of fire, and the guiner on the decay could get the sum at the enemy before the latter realized what was to happen. The strongest glasses on the U-boat would reveal nothing but the flat add of the decay, the sight protriding through the rubber. ig too small to be seen or if seen at all it would be mistaken for a rivet head or other mnecent-looking speck by the U-boat e-mmander

This arrangement would give to the decoy the first shot in action. It would be a surprise abot to the enemy and a strught but would possibly finish the sea pursite. The discharge of the gun would cut a hole in the dia-phragm which would be replaced by a new one, when the simp should be ready for a new action. The decay skip in action was protected by a series of false steel plates flush with the rall and bucyred when its the water and resolving from ten to twave feel below the surface Air chambers extending along the tops It would be a surprise shot to the enemy

of the plates kept them affact. These plates were attached to the ship's side by rigid steel ribs, which, when released, dropped away from the side. They extended a dustance of from 20 to 25 feet from the shap's

standed a distance of from 20 to 25 set from the shipt, and—a sufficient dataset of exploid a topped without damaging the reseal. The wall of water between the plates and the ships and would serve as a cultion in the event that a toppedo exploided against a plate II one plate were struck it would not affect the others as they were constructed independently of each other, being connected only by chance to form alignment. It was essential to have some sort of protection for decoy against possible torpedo stated from the U-host at the moment the deck gains opened from the U-host at the moment the deck gains opened from the U-host at the moment the deck gains opened from the U-host at the moment the deck gains opened from the U-host at the moment the dots of the withermelbe, but it would issued simultaneously a torpedo against its adversary. Host of the withermelbe, but it would issued the commanders of our decoys had to take this extra precaution. The sides was to drop the plates into the water as soon as the deck gains opened up on the seemy. The ship corride extra plates, so that if one or more were destroyed by a torpedo charge, tway could easily be

The ship correct extra pieces, or what if eace or more were replaced by others. It was not the ideas or more were replaced by others. It was not the intensition to long this piece was a state while the ship was running because they would have offered too much of a drag. Another nevention, designed to present the decoy against anthorough mines, was also offered the government by Mr Faber It consisted of a torped-chapted device operated from the breige or buy birst independent of the appreciate of a torped-chapted contract necessary for the appreciate, and the electric natural necessary for the appreciate, and the school contract necessary for the school of the scho

# Rolling 45-Ton Boilers for a Dutance of 21 Miles

I is one thing to rescue the boiler plant of a stranded ship from the clutches of the sea and quite a different matter to move the salvaged bookers to a point where

matrix to movi the alwaged bosters to a point where they may be put into a sivile again.
Late in the fall of 1017 the stransipp Bear went argument on the northern coast of californa. It was impossible to hast the vise 1 if the sands and the only alternative sale to salve as me he is rearge and fittings as passible. Banks to the a tivities of th. U houts this salp a plant represent 1 s high market value. There were six bid in in the vessel each worth about \$5000 and after the smaller stuff lind been taken out of the shap the bosters were removed. The plant was to take them to lurnak of it while they were to be shapped to bhappha and 1: installed in another hull. But here were, the bookies, or a disolate coast with no means of transportation at hand and Lurcks the nearest port lay some trenty few miles to the night like the night like the same as small.

were the bulk're or a disolate coast with no means of transportation as hand and Lurak the nearost port lay some twenty live mile to the nirth. It was no and it fast as the more than 1 he will be seen and it fast the more than 1 he will be seen and it fast the more than 1 he will be seen and it fast the first single stems was to ship them by an an area to be loaded on a nable neagreeton. It will be seen a fast to be loaded on a nable neagreeton. It will be seen a fast to be loaded on a nable neagreeton. It will be seen a fast to be loaded on a nable neagreeton. It will be seen a fast to be loaded on a nable neagreeton. It will be seen a fast to be loaded on a nable neagreeton. It will be seen a fast to be loaded on a nable neagreeton. It was not the seen and the continue to time but without success and almost a year clapsed before that plas was abandoned. The only other alternative was to roll the bollers along the coast to Humbold! Bay and that was no sumple task. A roadway would be required for the bollers to roll upon in places the rooks came down to the water a edge and a passageway would have to be blasted through them. There were two rows in the excessed. The bollers themselves were of such large diameter in proportion to that length that they would be very unsteedy. Neverthales a Lureke company contracted to perform this strange moving in).

a Lurcha company contrasted to perform this strangs moving juli.

Imbers were laid along the beach to keep the bollers from anking rato the said and a donkey segme was set about a quarter of a mile from the bollers. A 4-ment laid stop, the close was the said to the frame of the donkey rangen and laid stop, the close way it to the winding drum of the saigner. As the captain would up the limit be boller was relied along the readway but it showed a tendency to swing off to one ader or the other. However this difficulty was overcome by pulling the ground into to the safe boller headed off to the right the ground into the said bauled to the right so that the bught of the line would be headed off to the right the ground into the said bauled to the right so that the bught of the line would be headed to the right so that the bught of the line would be headed to the right to the the bught of the line would be headed to the right to the the bught of the line would be a time into almericant with the readway. The team was the tribed to a brick use the line and as it husber rolled up to the block it was loosened and slapped about The meavers became expert at correcting the rolling of the bushers and were able to the without stopping the engages. In the way the locker were railed one at a time in stages of a quarter [a mile for a dutance of 1 miles.

There were frequent delays while the roadway was

Then were frequent delays while the rotaway was being prepared Often work was instrupted by ide and storm. In some places the movern had to wast for the total control of the total control of the point of the being stored a rocky point that rached down to the water him.

The Bear three's hinch was the first six an encountered that not be the rolling process. A forth was control and the beat river the Pel no convenient ford was to be had been the beat process. A the second of the period of szere use nouzer were insued on a narg, and towed one at a time to a spot two miles away where the could conveniently be landed and rolled again. At Humboldt Bay the bulers were all loaded upon a single I arg; and toward to Eureka bringing this unique moving operation to a successful conclusion.

# When Freight Cars Bump

Recent Tests of Draft Gears, and the Resulting Developments

By Prof J Hammond Smith, Department of Civil Engineering, University of Pittsburgh

IN the early days of railroads car couplings and drait gears did not receive much consideration. In those days the engines and cars were light and me ved at comparatively slow speeds. But in the development of railroading the tendency toward heavier engines cars car loadings and higher speeds has been decidedly pro-nounced. And as a result lack of adequate shock absorbing devices between cars is the damaged cars as well as damage t the lading of merchandise which shifts with each impact. This annoying and destruc-tive effect is felt in all closes of traffic including the passenger service. Therefore including the passenger service. Therefore the scientific study of principles, and the the standific study of principles, and the application of improvements in art coup large and shock absorbing devices are of principles and shock absorbing devices are of principles and an articles and a standing from the railway engineering societies and especially from some of the foremost railway-mechanical engineers of the country

Louis I Indaley Professor of Railway-Mechanical Engineering at the University of Pittsburgh, has devoted special attention to couplings and draft gears for all types of cars. In order that better data for the design ing of draft gears might be available tests to determine the impact between cars in switching service have been successfully completed Fig 1 is a plan view diagram showing the application of the apparatus used in deter showing the application of the apparatus used in derivating the relative velocities and impact forces between cars when switched together at speeds up to eight miles or more per hour. A stretch of track with a uniform downward grade from A toward D so that the cars would just stand on the track without shifting dewnward when the brakes were off was selected. The string of D etc were coupled together but b cars H ( D etc were outpled together but before each test the slack in the couplings and draft gears was taken up so that the cars stood on the track with practically no stress on the couplings between them impact as in awitching, was produced by allowing car A to run down the track against our B at velocities measured by means of a stop-watch. A diagram of the impact recording apparatus (a photograph of which is shown at recording apparatus (a pnocograph or which is shown a bob in Fig 3 is shown adjacent to car R which was to be tested for impact received from meving car A. This instrument was mounted on a rigid stand at suitable height and distance from the track. R is a chronograph eylinder rotated at constant known speed by a storage battery motor having its axis parallel to the track and on which paper for receiving the autographic record was mounted. A guide bar F, parallel to the axis of the cylinder carries the pencil block P which was connected to the car at a point on the outside sill by means of a link G which was also parallel to the axis of the cylinder

This apparatus is therefore capable showing the relation between time and the velocity of car B, at any instant and since the variation in velocities during the hundredths of seconds may be determined accelerations can be determined with accuracy J F H in Fig 1 represents a record from cylinder K developed H J being the circumferential line traced by pencil P before impact. At impact car B is thrown to the left and as its velocity increases the pencil is drawn away from the sero line H J thus forming the raised portion of the curve as shown at E bince the maximum slope of the curve between J and E is a measure of the maximum velocity of car B and since the weight of car B with its load is known its kinetic energy may be determined by the

$$K = \frac{1}{2} \frac{W}{a} e^{a}$$

In which A-kinetic energy of car in foot-pounds, W-total weight of car with leading in pounds v- maximum velocity of car in feet per second as determined from the autographic record and g-gravity acceleration taken as 32 2 Thus, when car B, with load weighs 248,000 pounds, and the maximum velocity

is 2.4 feet per second

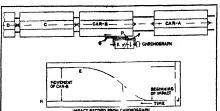

Fig 1 The apparatus for measuring switching impacts between cars, and a sample record

 $K = \frac{1}{2} \frac{248,000}{322} (24)^4 = 2$  100 foot pounds The kinetic energy of car A may be determined by means of the same formula For exar it using data from the same tost as that consider i above W = 248 000

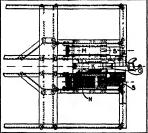

Fig 2 The newly designed draft genr with primary and secondary elements for withstanding heavy impact

pounds and v=5.55 feet per second from which K for car A is found to be 116,500 foot-p unds If no kinetic energy had been dissipated during impact one-half of car A a kinetic energy would be transmitted to car B (ance the two cars were of equal weight) but from the

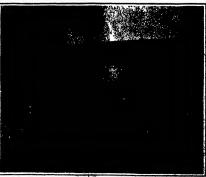

Fig 3. Apparatus used in testing draft gears and our sills. D-Impact recorder

above computations, we find a her 119,000 — 23,100 = 94,600 Soot-men This energy must have disappeared in form of friction. Sense of it was about in the draft genra, some by the shill loads, and the remainder was used y. straining and destroying both pars A

Impact force on our B, may be determined by means of the formula

F = We.

In which F seriors in pounds on ear B, W = weight of ear B with load, in pounds, a = acceleration of ear B, in feet per second, and y - gravity acceleration, taken as 22 2 Now in order to find the maximum force F, it is necessary to substitute the maxim

rains of sceniersidos. This measure seample record obtained from the sutographic record F, Fig. 1, by finding the largest difference in velocities of car. B at successive intervals of a fundardith of a second. For example, if the total weight of car and load is 248,000 pounds, and the maximum value of a is found to be 91.4, substitution in the above formula gives In those tests, the maximum force of impact was always found to take place before our B had moved always found to take place before our B had moved always found to take place before our B had moved by the control of the contr

next to car C

There are many types of draft pears, but all may be placed in either one or the other of the following classes; (1) Draft gears in whrh springs are used to absorb and distribute and thus alleviate the sudden abook. (2) Draft gears having friction discusse supplemented by springs, for absorbing a part of the impact energy. These types have single grimary shock up to the initial content of the property which are capable of absorbing a book up to the initial content of the respective when usually not over 200,000 pounds with a movement of two and a half inches. But when the shocks are heavy, as n raugh synthetic services.

pounds with a movement of two and a half inchess. But when the shocks are heavy, as an rapid switching service, where the pressures with ordinary car construction, with no absorbing medium may resch approximately 1000 000 pounds diraft gears having sangle shorbing unter have been found inadequate Grees ions in damaged cars and damaged shipping is the result. A new design of draft grar, by Professor Endelsey, contains features intended to overcome the defecte of the older types. In addition to the numary shock absorbing

older types In addition to the primary shock absorblas older types. In addition to the primary shock absorbing selected as used in the older types, be employ a secondary element to take the heavy shocks after the primary clement has reached the limit of its movement he above in Fig. 2, the primary draft par K, is contrally counted in the floating pare carrier S, in which are mounted the twin secondary draft passe M and N, the salls of the car registly connected to the salls of the car The springs and friction members of the secondary para are under initial stram, so that the abook first produces movement in the primary near

initial stram, so that the shock produces movements in the primary until it is nearly closed, when movement begins in the secondary mars. primary gear will close at approximating 200,000 pounds. If the horistst shocks, whether they tensile or compressive, may be damped without injury to the our, and with minimized injury to the contents of our contents o

and in testing draft geess and our The draft gear to be tested in one within the heavy side C, carrend in first end of the \$0.000, bound dar H, n is free to red on a straight level The impact is produced by a 15,000-is conducted. resonance is proceed a surface a surface as the same as represented to P is the same as represented in Fig. 1. # Stefansson in the Arctic

# A Summery of What Was Done in the Five Years of the Canadian Expedition

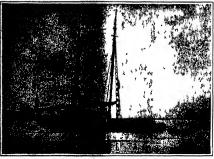

By John G. Holme

If there of approximately 256,000 square miles, or an interest of approximately 256,000 square miles, or a protect of share, was explored by Villajauar Selfanson, head of the Canadian Arctic Expedition, who has returned to civilanation after agending a little more than three years south of the Arctic Carole. The purpose of the majorour arcs, gather edentifie data on missine and exceptibility as meta-sensition of the analysis of the majorour arcs, gather edentifie data on missine and exceptibility as meta-sensition of the exceptibility and the exceptibility of the exception. In scientific excepts throughout the world, the keenest interest, of course, was sentered on the old question of whether the Pofar Bisin yeardened over the area of approximately

course, was centered on the old question of whether the Pfear Bein; extended over this area of approximately 1,000,000 square miles, or whether a land complex existed west of the known limits of the Canadian Arctio archipelago This question remains unaversed, al-though Biefanson did discover three stands of counderable suce But all of them are within or adjacent to the archi-pelago area Stefansson, accompanied by white companions, Andreasen and Storkerson, made a remarkable ice trip across the Beaufort Sea in the spring of 1914, going almost due north from Martin Point, and following a line between morid-ians 141 and 142 west to about 74 north latitude, thence in an easterly direction to Norway Island off the northwestern coast of Banks Island, a total distance of coast of Banks Island, a total distance of about 700 miles In the following spring, Biefansson with three companions, Andrease, Riorkersen and Thompsen, made another ise journey over the Arctic Sea, this time starting from Cape Alfred, the northwester point of Banks Island The explorer went northwest by north, more retrievestern point of Banks laiand. The explorer went northwest by north, more than three hundred miles then made a loop in a southeasterly direction to the southwestern point of Prince Patrick Island. On both these extensive see tripe and on

On both these extensive too kips and on subsequent too extravious covering lesser distances, such as his trip in 1916 from First New Hand to Cape Inschaen Eliof Elingues Laland, and thence to Second New Island, Stefanson took frequent coursings, observed the ocean currents, too drifts and prevailing wints. The result of this doke, los drifts and prevailing wints. The result of this doke, los drifts and prevailing wints. The result of this doke, and workward in the unsprinted region, but these indications chances, of ocurse, be regarded as proof. On the 1914 trip from Martan Point, is line of soundings was run from the Alaskan count northward between nervidians 141 and 142 West to about 73 North and theseo east to Norway Island. The continental slope uniform grade, while west of Banks Island, there were three well marked terraces between the depths of 200 and 1,200 meters. The continental slope motions grade, while west of Banks Island, there were three well marked terraces between the depths of 200 and 1,200 meters. The

60 to 50 miles of shore Once the continental shelf passed, Stefansson id no bettern at 1,286 see On the 1915 from Cape Alfred to an Patalek Island, Stefound McChure s reien Bazike and reiek felands, unStefansson s observations 200 miles north of Alaska showed a marked tendshey of the use to move seatward He found a strong current to the south or southwest west of Banks and Frince Patrick Islands quite as strong as the westward current along the Alaskan coast Stefassent from the evidence of any ourrent west and north of the new ulands. The prevailing currents in Melville Sound appeared to be toward the east. The prevailing winds north of Landson land was found to be north or Several places in the mark strongest being south by east magnetic disturbances, the most pronounced being in southern Banks Island. The ship's compass, carried by the expedition, became control unreliable a mile off

The "North Star," Stafagasen's most valuable ship, in the ice

shore, and Stefanston believes this may constitute a great danger to whelers. The newly discovered islands as well as the Ringnes island displayed indications of rising. Stefanson reports observing raused baselones methods not his land while sevated drift wood on Banks Island appeared to prove that this island had recently begins to risis. Methods the stefand had recently begins to risis. Methods and the stefand had recently begins to risis.

In addition to discovering three fairly large islands and many smaller ones, Stefansson proved the non-existence of the so-called King Christian Island which he found to consist of some small islands. With the aid of his companions, he mapped the northwest ra coast of Prince Patrick Island which McClintock had been unable to

Chistonia and Cox taking observations

An anofficial attaché of the expedition

finish in 1852, completed the north coastline of Victoria nman in 1892, completed the north constinue of victorial laiand and mapped the constinues of Finerald Isle and Ittswilliam Owen Island off Prince Patrick Island Both the shires of Hassel Sound between Filer Ringnes and Amund Ringnes Islands were retified and the average width of the sound proved to be over 15 miles instead of five miles as had been represented. Large

parts of the coastime of Banks Island were remapped First New Island was sighted by Storkersen on June 18th, 1915 This is the largest of the islands discovered The coast where the explorers landed was low but incuntains were seen in the distance toward the east The party penetrated 20 miles inland and from a linguit of 2 000 feet observed still higher hills at a distance of 50 miles north and east Stefansson fol-lowed the south coastline about 100 miles

then started toward his winter quarters at I wing spring 1916 Stefansson skirted the nuthern coast of First New Island chart m, the coastline and with four white men set off across the ice toward Lilef Ringnes island touching its northwestern tip and c ntinuing in a northeasterly direction. In June Second New Island was found. The June Scund New Island was found. The caphores returned by the way of Hassel Sund establishing, the non existence of king Christian Island supposed to lie south of Ellef Ringins Island and found litri New Island cast of First New Island August 1911. The mythical King Christian Island proved to consist of sex lat small lists such as may be found sex lat small lists such as may be found. anywhere in the archipelago region mer explorers had taken these uses to constitute one large island

The location of the three large islands is about as follows limit New Island has northeast of trince Patrick Island Its northern tip Cape Milmon lies in 78° 30 N and 108° W suitheastern tip Cape N and 108° W sutheastern tip Cape Mackay 77° 50 N and 110° W southern Ice Mackay 77° 50 N and 110° W souther tip ( spo Bouchat 77° 15 N and 118° W southwestern tip ( apc Murray 77° 55 N , and 114° 30 W

Second New Island hes North of Flief Ringnes Island,

Second Now Island lice North of Filef Rungues Island, and West of Axel Ruberty Island. Its evident points be as follows southwestern corner 70° 50 N. and 102° W. northern corner 80° 12 N. and 100° W. southeastern tip 70° 40. N. and 80° W. Third Now Island as the smallest of the three Its southern tip lies approximately in 77° 9 N. and 107° W. and 100° W. Stefansson also found a small reland off the northeastern tip of Yestors Island in the vulmer of 1017° total relations of 1017° W. Stefansson also found a small reland off the northeastern tip of Yestors Island in the vulmer of 1017°.

All the new islands were covered with vegetation and supported Arctic life except Second New Island which is barren for geologi al reasons Here Stefansson found

only Hutchins goese The other islands had reindeer m considerable numbers On Banks Island not vasited by white men since McClure was there in 1853 there were no muskoxen although Mc-Clure reported having numlers Stefansson be killed off all these animals of late years

the Canadian dition was one of the most elaborately equipped exploration ventures ever launched the Canadian (lovernment sparing no expense in making it complete for Arctic investiga tion Stefansson left Teller, Alaska June 27th 1913 at the head of a party of 13 scientists sail ing on the whaler Kar luk, commanded by (ap Robert Bartlett

# America Flies the Atlantic

# The Design and Development of the NC-4 (Navy-Curtiss Flying Boat)

THE genesis of the pian of the Navy Department to provide able sea-keeping ariplianes for deep sea work is to be found so far as the Navy Department records are concerned in a memorandum by Rear-Admiral D W Taylor Chief Constructor of the Navy, bearing date of August 25th 1917, which reads

as follows The United States Motor (Liberty) gives good promise of being a

and of the case and the arrival grows good promise of being a success and if we can push shead on the airplant end it seems to me the submarist menase could be abated even if not destroyed from the air.

The ideal solution would be big flying to do to the equivalent that would be able to keep the see (not air) in any weather and also able to fly across the

be sole to keep the sea (not air) in any weather and also also to by second the Atlantic to avoid difficulties of delivery. Flease think it over very carefully particularly as to the method of procedure to develop something as close to the ideal as possible.

A few days later than it is Commander to C Westervelt Naval Constructor. who had just returned it on abraud where he had no eaved werry opportunity to examine what was being done in the design and construction of artifactes and seaplanes of large sizes and J C Humsaker assistant for aeronauti all purposes to the Burna ut G construction Repair were called in by Rear Admirth Tayler to discuss this subject. On Styte inher 10th following Mr Gkinn II Curtise and two oll his technical assistants were called into conference at Washington and shortly after that Mr Curtise returned to Washington with a cased by the Chief Constructor. As the result of a conference of the gonit men mentioned above it was decided to go shead with the design of a three segme flying bast of about 1000 horse power the boat to be as large and its radius of action as great as could be priduced with this power. After a number of features which it was desired to embody in so large about had been worked out under Assistant Naval Constructor Humsaker is contract was made with the Lurius profiler the design for the made with the Lurius profiler the design for the made with the future profiler the design for the property of Naval Countrator Washington and was carried to completion under the supervision of Naval Countration Foundation for the supervision of Naval Countration Westerfut to whom had been given charge of the work, with whom were associated Assistant Naval Constructor Humsaker representing the Bursau of Construction Representing the Bursau of Construction Repair and Naval Constructor Humsaker who had just returned it am abroad where he had received every opportunity

soris, with whom were associated Assistant Nava Constructor Humsker representates the Bursau of Construction Report of Nava Constructor (Inc.), Commander), H. C. Rithardson, Commander Richardson was responsible, particularly for the boat hull a most important feature in a successful flying boat. The use of a short type of hull with the tail supported upon it by means of an auxiliary outrager construction was the suggestion of the Curtise people and was based on a small flying boat which had been already built by them.

Speaking of the details of the design it cannot be ascribed to any one person or organisation wherever an idea of value was picked up or was brough notice of the designers it was studied and if found useful adopted in fact the widest catholicity of spirit was used throughout the whole enterprise. The Navy a showing or spirit was seen unroughout the whole character in the as for making, in experimental sentence, in grant greatly sheever it is due as for message, in respect to many of the most important structural details such as the rhs, wing posts compression structs and wing beam which are generally smallar to those of the first deep-Fage might bombing arphanes definite information regarding these details having been obtained by Naval Com governly(amiliar to mose or the resource-rage man common anymore scenible information regarding these details having been obtained by Naval Constructor Westervelt during a recent trip to Logland
Early in the development of the enterprise, the first large flying boat was designated as the NC-1 in which N stands for Navy C for Curtiss and the

sesignated as the Novil. In which a standard Novil Cor Curtus and the figure I indicates the first of a series of boats of this class. It was in December 1 and the figure I indicates the first of a series of boats of this class. It was in December 1 and the first of the construction of four NC boats and because of their great ase, the Navy Department errored a sperial building at Carden City for the building and assembling of the boats two of which can be assembled at one time in the building.

The first design called for a bost of 25,000 pounds gross flying weight, with the following dimensions

Span 140 th area 3 370 aq ft loading 7 5 lba persq ft weight 25,000 lbs, load 25 lbs per B H P (normal power) fuel 8 250 lbs or 15 hours erew 1,000 lbs or 5 men margur 750 lbs or 15 hours useful 10,000 lbs maximum

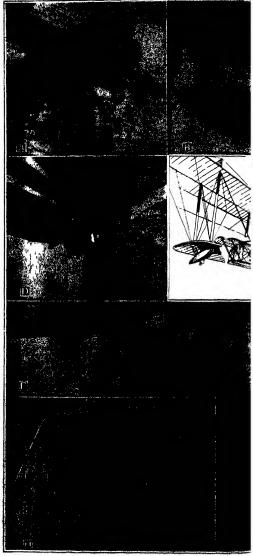

When the design had reached the point where it was possible to estimate its resistance and speed it was found that the three Laberty engines would not

reservance and speed it was found that the three Laborty segmes would not develop selfin sum power to obtain the descred results, and the weight and develop selfin sum to self the selfin self

cause of the great size of these craft it was early realised that if they were to be built without serious delay it would be nonseary to construct them on the assembly basis. Under this system the different elements were given to magnifacturers who already were turning out a product of a somewhat similar manuscrumen who arready were turning out a product of a somewhat similar anature or a product requiring workmen of qualifications similar to those of workmen ordinarily employed for work of the nature contemplated. After the various parts had been ompleted they were to be shipped to Garden City and there assembled into the complete flying boat

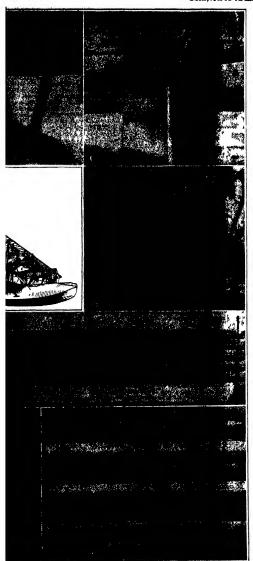

## The Boat Hull

Inasmuch as Chief Constructor Taylor in the memorandum referred to maximum at cumerical specific production of the memorandum control of

mpt. F. Administry at quader of surviya.

2. Francowith of the radius, I, Ou

space and book. Center Steech Key drawing of an NO Sping book. E Junction of ner monden again visited form the three-sided owingsor trees.

strong and yet extremely light for its strength and such it is. Two strong longitudinal trusses are incorporated in the structure, of the hull and through them, largely are the heavy dynamic stresses due to landing in rugh weather, distributed throughout the lost. The cross section of the immerse I portion of the boat shows a V-section which runs right up into the st in and serves an landing to cushon the impact of the as. Cut trary to popular thing the third the land of the state not a great obstruction to swift | issued through the hall is not a great obstruction to exist; awage through the air. That is to say the head restance is not great. It has been to the fact that its form was designed to present the minimum air restince when in flight and in this respect it is believed to compare to tally with the resistance of the landing goar for an ariphase of the same weight in less: I unfur more the hall was designed with a view to securing a positive vertical traction when the instance is in flight. As a matter of fact the wind tunnel tract of a model of the boost designed with the lefters of fact the wind tunnel tract of a model of the boost designed. showed an actual lifting effect of several hundred pounds at full speed

# The Wing Structure

As will be noted from our illustrations the wing ribs are built in the form of triuses with vertical and diagonal insubs is and the brains are of hollow box-gorder construction. He meaninum depth of the wing is about 14 inches Their chord is 12 feet. The strute are of hollow built up sections and show a careful attention to stram liming. Those who are familiar with the Handley-Page constructon will see many points of broad resemblance

#### Special Details

It is scarcely necessary to say that in the hands of our Naval constructors and the staff of the Curtiss Company nothing in this powerful machine was left to mere guesswork—lust as in bulge design a skeleten strain sheet is drawn up with the maximum stresses indicated on every chord post disgonal tie, etc. so in the NC's the stresses were accurately determined and care was taken that nowhere should the clastic limit be exceeded. In order to handle taken has nowner as much in classic matter extended in order to mande the first seed of the control of the control of the control of the first seed of the control of the control of the control of the control of the best in by a study of the dat his shown in Figure a D and F. To provide against crushing or froming up of the nots of the strutes or posts, the tested pockets which received them are first lined with soft sheet copport which, withing under pressure all we the end of the post to adjust thereff with a fairly withing under pressure all we the end of the post to adjust thereff with a fairly even distribution of pressure

# The Tail Outrigger

So large are these surplanes that one does not realize that the tail of the So large are these implanes that non-mode not require that the tail of the machine is a large in its if it is some of the small last southing land planes, and to carry it far to the train (it) both and the plants and hold it firmly in place and in line called for some very new designing. The ourigage poster of beams were constructed by several of our new twint builders who have had expensive in the construction of hollow masts for ricing yachts. These beams are hollow and are heavily wrapped at intervals to add to their strength. The thinness of the shell is shown in Figure I where several beams which have been tested to destruction see lig I are shown out in two with the severed ends presented to the camera.

# Fourth Engine Added

The first of these flung boats was completed in October 1918 approximately one year after the commencement of the deep nat was first flown on October 4th it was apparent at once that the boats would be successful beyond the expectations of the designors. It was understood that had there been time to build and metalli grant-down engines for these boats, their performance would have been materially improved but it has been implementable to produce engines for these boats, their performance would have been materially improved but it has been implementable to produce engines of this type of sufficient propers under the stress of war work and as yet no such engines had been made available. Hence it was necessary upon the approval of the trans-Atlantic project to materially modify the engine arrangements and install a fourth engine. This was necessary to the engine arrangements and install a fourth engine. This was necessary to secure sufficient gasoline capacity to carry the boats over the longest stretch scure sufficient gasoline capacity to carry the docts over the longest attended to the proposed trans-Atlantic flight house to a sufficient proposed to the proposed trans-Atlantic flight house to a sufficient proposed to the flights was done at the Rocksway Beach Naval Air Station, where special hangar and handling arrangements were provided the station so an anarow peninsular on one sade of which is the Atlantic Ocean and on the other the smooth water of Jamaica Bay which latter affords water landing in any weather while the nearness of the ocean makes possible the carrying on of ocean sea tests with minimum difficulty. It should be mentioned that outside of the long flights made in the train-Atlantic attempt on November 24th of last year one of these boats broke the world's record for passenger-carrying by making a trip with 51 persons on board

# Seaworthmess Must Be Improved

When Admiral Taylor in his memorandum called for special attention to when somes a system in a memoratorian consideration as seen in a secondary to seworthme or of the ability to keep the seen as against keeping the air he laad his finger a the event was to prove upon a most important dement in a transition for in the last the proventies of the system of the secondary of the weather that for a boat to get through without risk to its frought. instanty of the weather that for a heat to get through without risk to its freight or passengers it must be prepared to come down and take whatever comes the way upon the surface of the water. Not I and No 3 were put to this tead, and so far as information has been given out it looks to have been quite a severe test, one of the boats sunking while it was being towed to port and the other, pluckly) navegated by Commander Towers though it succeeded in residency port, was so badly wrecked that it had to be dismanded and sent home. The damage in the/see of one book seems to line be in due to the inertia of the center part of engines proving too much for the straight of the strate which carried the tenter of the center of the

# World Markets for American Manufactures

Edited by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

## Progressive Venezuela

POURTEEN years ago the agent of an American manufacturer of fain implements stopped in Venerate on his way through South American Ventuag Caracos the capital of the rejubble he met the president and was invited to inspect the tonlefe con evite. Fairn not far fram the city. This trip resulted in the sale of word mowing machina is the hardly any other business was done by the agent in Venezula. Onsequently his company discided that other markets are more promise company desided that other markets are more promise. A number of American firms has ding various lines had similar experiences and ip to five years ago the volume of our trade with Venezuela was comparatively

It has been more difficult for American exporters to sell goods in Venezuela than in other countries largely because of its customs regulations. Great care must be exercised in making out consular invoices which have to be in Spanish. It is necessary to list each item exactly to be in Spanish to be the spanish the increasing to mark a first and since and it is described in the Venezuelan tariff law and since are imposed for the use of ditto marks and abbreviations. for all errors I specially noteworthy is the that making shipments with drafts attached to docu-ments gives no socurity for the consigner named in the consular invoice can obtain goods from the customhous-without presenting invoice or bills of lading. In recent years the establishment of branches of American banks energels has helped to evercome this obstacle. Import duties are levied upon gross weights which must be marked upon all packages in kills (A kild is about 2.2 pounds). That means the lightest possible packing

# Trade Leaping Over the Hurdles

The barriers just mentioned have not prevented our sales to Venesucla from more than doubling since 1914 With the high market price of ceffee in Venesuela at present there is every prospect for materially increasing trade with that country. We have most of our southern neighbors chief product and naturally we should like to keep our high place in Veneziela s import business. In this connection the following statement of a commer-cial agent of the Venezuelan Government sent to the United States upon a special mission is encouraging Venezuela is more interested in developing trade with the United States than with any other nation We have a very cordial sentiment for your country and my Government desires the extension of commerce

This envoy will recommend changes in the customs regulations that will make it easier for the American shipper to deliver his merchandist in Venesuela. He is conferring with the principal business men of the United States in order to learn the reasons for their failure to give based in the south of the same time that the great need is a rapid passenger and freight service from New York and New Orleans to La Guarar the principal port of Venezuela about 2000 mules from each. In the past it has been possible to make the trip from La Guarar to Lurope a much longer voyage in the same time as that to the United States American capital for the develop-ment of agriculture (attle raising mining and other industries will be very helpful in stimulating the sale of our manufactures in Venezuels. We want your busi-ness men to communicate with ours and to study not

#### only the riches of our soil and the opportunities in our trade but the paculiarities of our commerce and of our psychology said a recent visiter from Caracas What We Can Sell and How We Can Sell It

The principal groups of buyers in Veneziela are the overnment—the petroleum and coal development (rovernment companies the large importing firms and the retail merchants. There are less than 600 miles of railways in the republic. More lines are needed to move agri in the republic cultural and mineral products to the sea and to open extensive tracts for innugration. The Government is also improvement such as graders rotary sifters stone crushers and other equipment. The expanding highway countries and other equipment. system will require numerous bridges owing to the many rivers that must be crossed. Existing bridges are said to be narrow and inadequate and these must be replaced with better structures One of the best bridges in Car-acas was constructed by an American company Public improvements of this sort are paid for by taxaton and not by bond issues Generally speaking, the Govern-ment requires orrelit for six months or longer It is reported to be in a good financial condition at this time

Iwo American corporations have opened petroleum wells in the northwesters part of Venesuels and another American company holds a valuable coal consection in the Maracalbo dustrict These and additional enterpress import large quantities of such commodities as preserved foods iron and seed manufactures, and of the import trade of the sountry was controlled by the company of the company of the controlled by the company of the controlled by the controlled by the company of the flower of the sountry was controlled to the flower of the controlled by the controlled segment advancing money on crops and on agracultural products stored with them, which they purchased or sold abread on commission On the contrary they bought from foreign manufactures in a cash beass sching to the Venesuelan retailers in their own terms

# Dealing Direct Brings Best Results

Besides being the capital and largest city, Caracas is the center of commercial settistics in Venezula Practically every company engaged in business in the republic maintains its principal office in Caracas and all general agencies should be located there. Simewhat more than a year ago an important American mercantile firm estab-lished a branch house in that city. Jarge stocks were carried from the start and business has increased with startling rapidity because this branch can sell to smaller marchants much more cheaply than hean sail to smaller merchants much more cheaply than they can import for themselves On the other hand one of the American banks in (aracus will take orders f r goods and deliver them at the purchasers warehouse with cost freight

them at the purchaser's warehouse with cost irregart
insurance and duties paid

The standing of Venesuelan firms is high and excellent
results have been attained by many American manufacturers who have granted them seeners. This is
especially true of distinctive American products.

There is no question that the most affective manner of expanding our sales in Venezuela is direct representation ing our sales in Venezuela is direct representation, a through either an American Branch louse or assponsi-ble native merchant The Chamber of Commerce of Caracac composed of the most substantial business man in the capital will supply credit information to American exporters. It is essential to attend to the regularition of trade marks before seeding goods to Venesuela. This affords protection for a period of 30 years.

# Shoemaking a National Industry

Shoemaking a National Industry
Imports of shoes from the United States are imagnificant because of the very high duty \$274 10 per 100
pounds gross worsh' which review the loved industry
Upper leather and shoe finglinest burchesed shroad, but the soles are made in Yessenth purchased shroad shoes bring from \$12 to \$20 per peir in the review of the shoes bring from \$12 to \$20 per peir shoes the per sheet quality
of leather costs only \$7 Italy France and Great
Britan manufacture most of the hate sold in Venezuela
Span supplies most of the honery Good shurts made
locally were to be had for \$15 00 during the war, thus locally were to be had for \$1.50 during the war, this price will probably decline to \$1 in a few months. An American firm has sold fair quantities of wearing

apparel and other merchandise in Venezuela by parce post This method is growing in favor primarily because no consular invoices are required and there can be no customs fines for mistakes in documentation. Our customs fines for matakes in documentation Our parcel post business is likely to suffer however from European competition, because the rates from Great Britain France and Italy at the lower than those from the United States A Venesuelan law that requires the panting of the fronts of all houses in La Guara and carness each year in May, just before the national congress meet is a factor influencing the steady importation of colors and varnishes. In 1918 more than three control of these materials class from the United States which we have the control of these materials class from the United States made with oil. Importing seed, in the part of those made with oil. Importing seed, must be sufficient to those used in the United States.

# Increasing Our Sales Force

MoST young Amencasi have a dozer to see the world, but those whe go abroad usually do not remain region in foreign dilates. The good ald United States as the best country in the universe to live in said to work at The result is that comparatively few American discuss take up their jerranent rendence abroad country in inside our foreign trude, for all our country of the country in the country of the country o

Until American manufacturere eas areas ellegislasty a sufficient number of young men to represent these in other countries, they would do well to say attention to the sore of sea direct and to be secured from the American insection to the sore of sea direct and to be secured from the American sensionary in India became microscopic area as a present in the United States. For instance, as an apresent in the United States. For instance, as American miscionary in India became microscopic in American miscionary in India became microscopic in India and machinery Eventually he was appearined agricultural development of American miscionary in India director of the important nature saise of Creation, when a large as West Virgmis. Thousands of collars worth of central India because of this man a efforts.

The average American issuries starts out with the idea of pleasure brown a great deal of pleasure from attending to just a study business, and if the or more of the laster. When some American measuricetyrary go abroad, however, they denive a great deal of pleasure from attending to just a study business. And of pleasure from attending to just a study business. And of pleasure from attending to just a study business. American product—and finding it delectable. In order to increases the size

In order to increases the same or the bundles it is necessary to move the com-pressor arm out on its support bracket To increase the tightness with which the bundles are bound it is necessary to tighten the compressor spring and sometimes the trip spring. The twine tension should never to tighte ned for this purpose. Some of the common troubles are listed

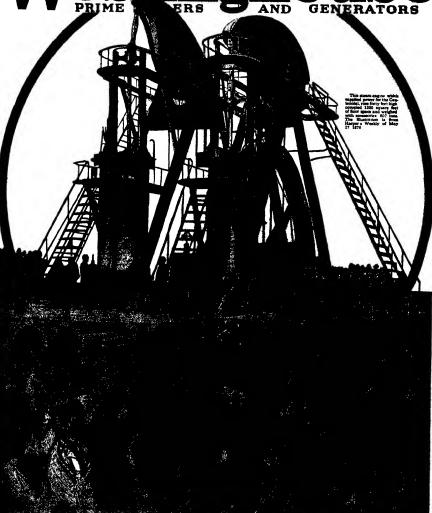

as follows

as lonows

1 Loose Turne Disk The twine disk
should hold the twine so tightly that a should hold the twine so tightly that a pull of about 50 pounds is required to drawit from the disk spring. If this spring becomes loseened two conditions may be ment with (a)A band may be found clinging to the hill-hook with a loose knot clinging to the nin-nook with a loose knot in the end while the free end has the appearance of having been cut aquarely iff. The trouble here is that the twine-disk spring was so loose that it released one end of the twine but the other end was placed.

(Continued on page 816)

OUR CENTENNIAL PRESIDENT GRANT AND DOM PEDRO STARTING THE COLUMN SECTION A SERVIN SY THEO. R. BAVE.

# Westinghouse AND GENERATORS

# Dwarfing the Giant's Might

When President Grant started the mechanism, and the mammoth Corlies engine in Machinery Hall began to throb with life, crowds at the Philadelphia Centennial witnessed what the world in 1875 proclaimed the crowning glory of steam-engine development.

Today, scarcely more than two score years later, Westinghouse Steam Turbines, in size but pigmies beside the "grand mechanical monument" of 1876, are producing five tings the power from the same fuel—power that lights great cities, turns the wheels of countless industries, drives thing across the seas and performs various other important testis.

With all its great size—it occupied \$4,000 cubic feet of space—the Centennial stant delivered 1400 horsepower. A Westingstrase Turbine of the same capacity would require but 115 cubic feet.

This advantage alone makes the steam turbine one of the out-standing achievements of the past quarter century. Because of the, the public annually saves millions of dollars.

To the ship-owner, this economy of space means more cargo—to the shipper quicker service and lower rates. To central stations and electric transportation companies it means greatly decreased investment in real estate and buildings or less expensive expansion—to those who use electric light, heat or power, it means cheaper current, to those who ride in electric cars and trains, low fares.

The steam turbine, moreover, has cut the world's fuel consumption by millions of tons a year, with incalculable savings in labor and transportation, and effected other economies

Westinghouse brought the Parsons steam turbine to this country in 1895, when it was still crude and imperfect, and through years of costly painstaking development, raised it to its present high degree of reliability and efficiency.

One important result is the Westinghouse Turbine-Generator for producing electric power.

Today Westinghouse Turbines and Turbune-Generators are made to develop from ½ kilowat to 70,000 kilowatts. Already they have accomplished a revolution in electric power-plant practice and they promise to do likewise in the designing of ships.

# TIMKEN TAPER

You can always recognise a Tinken Bearing by its taper tapered rollers revolving about a tapered cone within a tapered cup. To the taper is due two things that havis given Timken Bearings there supremany in passenger car truck and tractor.

1 Resistance to wear — because a tapered roller bearing resists end thrust

the aidewise pressure of the vehicle's weight as it rounds a curve just as well as it does the steady downward pressure caused by gravity

2 Take up for wear — because when the surfaces of cip cone and rollers become slightly worn a part turn of an adjusting nut brings them together again and the bearing is as good as now

# plus Timken Tubing

'At the rate you're piercing those bars and rolling them into tubes," said one tube-mill visitor, 'you ought to have enough soon to make bearings for all the ears in the world"

Other visitors to the Timken plant at Canton have thought the same thing when they passed by the bins of stock tubing housed in long sheds Millions of pounds of tubing there are here of all diameters from three quarters of an inch to six inches

Here is enough saw material at hand to make up cups and cones for any order of bearings of any size, and constantly this pile and that is being replenished from the tube mill

The careful control not only of the material in these tubes but of every process involved in piercing, rolling and straightening is essential to the maintenance of Timken quality

It is one of the many things that are added to the principle of Timken Taper to assure the resistance of Timken Bearings to the effects of wear

# Make Your Roofs

LEAK-PROOF!

You can make them absolutely watertight for ten years by coating them with Stormking No chance of failure for we guarantee results.

This seamless, asbestic coating is not expensive Cost of application negligible.

BUT -more important, it saves the expense of tearing off the old roofing

Simply brush Stormking Liquid over any roofs or trowel Stormking plastic over badly worn surfaces and forget them until 1929 No repair or repainting expense after Stormking—one application is sufficient

# If Horace Greeley Were Alive Today

Would be advise young men to go West or would he advise them to take advagtage of the opportunities that abound in their immediate vicinity — Knocking at their door" as the saying goes. Undoubtedly he gees. Undoubtedly he would teil them that every-where is this ba and prosperous country there is opportunity for the young man who well use his brains, acquire knowledge, and get

Let use tell you of at least one opportunity right in motor own town.

and barracks had been erected a steam shovel was at work piling and timber had been assembled a 1 500 horse-power light ng plant from the States had been receive and was ready to creet 2 000 men were a work—and then the armistice Talmon would have provided space for the heaviest draft vessels and allowed 10 000 tons

day to be unloade !

Just what is to be one of the dock facilities en ct. l taken over improved Americanized is something which no or seems able to say It would seem far more logical to sell the whole to the Fren ! than to attempt to salvage the material f transportation hak to America can be ne salvaging the lab r which we into these projects and no possible way other than sale to the French of recovering even a small proportion of the money spectup on their development. Doubtless son equitable arrangement will be made by which the French nation will benefit by the American work and the French ports.

the American work and the Preach ports in the future possess a degree of American officiency in unloading which will be blest of mariners for generations to come! But such speculations belong to the concornist not to the reporter It is impossible to find an engineer who does not regret that his branch of the service of the control of could not continue to function and to show the world what we can do when we try — It is more implicable to find any who regret that what stopped the work was the defeat of the enemy

The effect upon the commercial methods of France of this influx of American spec i and efficiency in dook and unloading methods is not for consideration bear methods is not for consideration be What may perhaps be noted as a matter of passing if currous interest is that there is hardly a dock in America with the capacity or the speed of those America has ere France and that if we have the right to show the French engineer with some prid what America has done to his water front what American a sound to mis waser tour back in asking us why we have for so long and in so many places put up with outirely inefficient methods of docking and unload

ing in our own ports

But that perhaps is also something
which belongs to the economist Suffic
it here that no American concerned in the making of the American ports in France no American of our 2 000 000 who has been served by them and none of the hundred nullions who stayed at home but has a real right to be very proud of what our engineers did on the coast of France and a real right to feel that no matter how much Europ may call us a nation of boasters we have in this particular at least fully demon strated our right to boast of our engineering ability ingenuity and efficiency

# Killing Weeds With Live Steam (C mitnued from page 589)

prevent the steam from escaping and the boards from warping Hoop iron is fastened around the dges so that the pan

Instead around the dogs so that the pan hugs the soil closely and so that the steam will not seep out. There is an opening througl one and of the pan through which the steam is admitted. The pan is provided with ring both near the corners so that it may be easily moved. The steaming may be done either in the spring or the fall. The disadvantage in fall steaming is that the beds may become fall as the steam is the steam panel of the steam and the steam panel of the steam and without frost in order that steam may penetrate the ground. Class-covered beds may be left on for a few weeks before seeding time in order to dry the beds set Sample. time in order to dry the beds out times when good weather is encountered in the spring the steaming will be carried on for 24 hours at a stretch

After a bed has been steamed for minutes the pan is moved along to the aget point. The steamed area in the menatime is covered with a blanket to conserve the heat. Two pans may be used, one being left on the soil a half hour

An automobile is only as good as its rear axis. Remember—you may have the best engine in the world in your car but that does not and cannot make it a good motor car unless the rear axis is mechanically correct and physically perfect.

Few people realise that the reur axis of an automobile is next to the entire the moving a good automobile is next to the entire the moving a good automobile. # IMPORTANT ANNOUNCEMENT

HE large increase in our practice before the Patent Office since the close of the war has led to our opening an office in the City of Chicago for the convenience of clients in the middle west It is located in the Tower Building, corner of Michigan Avenue and Madison Street

The SCIENTIFIC AMERICAN has for many years had an office in the Peoples Gas Building. This office has been transferred to the Tower Building and is consolidated with the new office of Munn & Co

CHICAGO OFFICE 801 Town Building Michigan Avenue

MUNN & CO

Pa ent At orneys Woolwor h B Mong 233 Broadway NEW YORK CITY

WASHINGTON OFFICE Scientific American Bu king 625 F Street

has been found that 30 minutes' steaming will heat the upper two inches of sell to from 20 to 212 degrees Fabrenheit. At there to four inches deep the thermometer will register 170 to 180 degrees, and at ax inches 120 degrees Two hours later the semperature at six inches, 11 has been

temperature at six indexes, it has been found reaches 100 degrees

The cost of eteaming 1,000 square feet of six is shout \$80. It is figured that the saving in cost of weeding will shout pay for this. It is also necessary to use less for this It is also necessary to the fortilizer on sterilized ground than on tensic ribred. The seed may be sown safely steaming the beds. While 12 hours after steaming the beds While the plants seem to be retarded at first, there is later a decided growth, so that they are ready for setting out two weeks

## Much Wheat -No Corn? (Continued from page 600)

Il g raisers are evidently secure in the feelug that there is plenty of corn in sight N w for the last comforting straw There are always two factors in the produc tion of any crop, acreage and yield per acre. Nield per acre is a great variable acre held per acre is a great variable Climite rainfall, temperature, drought, wind frest they all affect the yield

But the variation in the corn crop in the veries between 1910 and 1918 are the variations between 2,446,988,000 bushels in 1915 and 3 005 233 000 bushels in 1917, in 1910 the crop was two billion eight hui Ir d uillion in 1918 it was two billion five lundred million bushels. Corn has been a constant, not a variable, in spite of war in spite of the increase in the price of wheat in spite of everything. Not quite accept millions more acres were planted in winter wheat this year than last There were 12 million acres difference between wheat a reage planted in 1919 and 1914 het in variation in corn planted between the nearest years to those for which figures can be had, 1914 to 1918 was the difference can're nad, 1915 to 1916 was no disrevence between 103 and 107 million acres and, in the amount reaped, the difference between two lillion are hundred millions and two billion five hundred millions bushals If twelve million acres planted in wheat made white difference in over harvested why should seven millions planted extra this year in winter wheat make so much

this yiar in winter wheat make so much differen in corn to be harvested?

The Department of Agriculture will verture no opinion. But all its reports, while he set shy of figures, show one our against the corn situation. Loss wise than it is and much holder (as the fool must always be who rushes in where the angels wont walk) the present writer is quite willing to predict that the corn crup this year will not be a factor in raising the pinc of meat, either by its scarcity or its unusual size

## American "Mystery" Ships (Continued from page 600)

drags It is obvious that these arms sacountered considerable resustance as they appead forward through the water, and the little rudders placed at the proper angles would keep the arms extended

This mine drag system was applicable to all types of vessels operating in danger-ous or hostile waters. It was simple and cheap in construction easily operated always under control.

Although the German U-boats reached American waters and were successful in surking a number of vessels operating on this side of the Atlantic by some chance of ill-luck our decoy ships were not in the vicinity of the submersibles when the made their attacks. Of course with only two decays it was rather difficult to guard the entire coast line of the United States The commanders and crows of the myster, ships were very much disappointed that with their excellently equipped vissels they were not able to sink a single seri unting season was open for Germans

# When Freight Cars Bump

(Continued from page 602)

its lowest position, until the shank of the its lowest position, until the shank of the draft gear is in contact with the face of the hammer. Then the hammer is pulled back until its center of gravity is raised a certain number of inches, and suddenly certain number of mehos, and suddenly scleased II swings downward and gives up a part of its energy as a hammer blow on the end of the draft goes thank. The draft gear absorbs a part of the energy delivered to I and passes the romainder on to the car, which takes it up in the form of motion. By means of the autographic record of the chromograph, the autographic and velocity of the car may be determined as in the tests previously described, from as in the tests previously described, from which the maximum pressure on the draft's gear and transfer of energy from hammer to car may be determined. Blows of varying intensity are delivered by ad justing the drop of hammer from sero up to the maximum which is required to produce a full closure of the draft gear, or failure of its connections to the car

Blows from a 16-inch drop of the 15,000-Blows from a 10-inen drop of the 10,000-pound harmer have been delivered on certain types of draft gears producing a pressure of 870 000 pounds, but on other types of gears a drop of 22 inches produced a maximum pressure of only 186,900 pounds

# Stefansson in the Arctic

(Continued from page 608)

pologist by profession, and on his staff were specialists of note in oceanography, ter-restrial magnetism, marine and terrestrial biology, geology and topography There was stored on the "Karluk" a most complete and varied collection of scientific instruments some of which could not be instruments some of which could not be duplicated is uch as the oceanographic instruments loaned the expedition by the Prince of Monaco, an oceanographic of reputation Most of these invaluable instruments were lost on the "Karluk when the ship went down off Wrangell Island on January 11th, 1914, after drifting in the lee for several months Stofansson had left the "Karluk" with five companions on beptember 30th, 1914, on a hunting trip, expecting to be gone shout a fortsaight His party reached the Alankan mainland and never as with Karluk sgaia, the and never saw the Karluk again, the tee off shore breaking up and forming a lead which could not be crossed. Thus the explorer started off on his Arctic tour, which was to last about five years with simost no equipment He picked up a few

land party of his expedition, and proceeded Of metruments, Stefaneson carried a sextant and a mercury artificial borison, sextant and a mercury artificial fortison, prisamatic compasses, several watches, a sounding wire of 1,180 meters, deep-sex thermometers, a number of comeras, and two Mannheher-Schoenhauser 615 indii-mater (265-indii-mater (265-indii-mater) and a fire with Gibbs siddification, much used in Africas hust-ing and have a music evictory of 2,300 fpss. The watches were ordinary standard Absorbins interprison, which Stefansson

# DU PONT AMERICAN INDUSTRIES CONTRACTOR CONTR The Greatest Chemical Industry In America

In 1802 the Du Pont Company made its entry into the chemical industry as manufacturers of explosives

obeniceal industry as manufacturers of capl saves brince then with our entry into i cit. I have it in his pyroxylin and coal tar chemicals. Label it point a generals, ascads and synthitic described our charm at mirror back grown must today in the Du Pont American Industries that, has developed the greatest chemical organizar in in America. At the present time 1200 graduate chemists, at all it has executed if the data number in the Lord (ASLES) in an industrie.

At the present time 1200 graduate chainsts at all ut ten-per cent of the total number in the United States are en ployed by the various Du Pont conjunies

lour great research hi intoins operated by the company's Chemical Department complying in the neighborhood of four hundred technically train t iron sic maintained by our com-pany to entry on experimental operations for the improvement of existing processes to find the means of utilizing our by products and the most economical raw materials and to develop

nees and the most community raw materials and to develop new products.

Lor work of this character two million dollars will be spent this year by the Du Pont Company exclusive of capital ex-penditures for bindings and equipment.

Hurty analyti al lat oratorics are operated by our companies in the testing of raw materials and intermediates to control the quality of our finished products

A large corps of thems al engineers supervise the manufacture of solvents. Py ra-lin and explosives diestiffs etc. and promote the maximum chemical efficiency in the operation of our sixty plants

In the world reconstruction era this broad American chemical

industry will play an important part

The same logical reasons that led to its present diversified activities point to further expansions into other related fields of industrial changetry

E. I. duPont de Nemours & Co. Wilmington Visit Du Pont Products Store when in Atlantic City

says he has always found preferable to their the distribution figures and a second substantial and the second substantial and second se

spot in the Arc ics During most of the time, Stefansson and his men and dogs lived off the land and comfortably on meat and fish alone in the somiorably on meat and man alone in tase far North There were few metanose of fliness Three of his men became ill with earryy from eating stored food. When Stefansson compelled them to eat nothing but fresh meat they rapidly recovered the harluk was of course intended to

be the major vessel in connection with the expelling and although there were four experient a and atthough there were four other consects in the hands of the explorers, it was necessary to replace the lost ship It was in this way that the North Star, which we illustrate came to be part of the which we illustrate came to be part of the outfit. Flough materially smaller than the Karluk she turned out to be of greater value than any other vessel of the

## America Flies the Atlantic (Continued from page 605) Lessons of the Future

Great credit is to be given to the technical talent which was engaged in the design of these flying boats. The event has proved that if a set has not yet progressed to the noint where we can build boats of sufficient strength and radius of action to make a sure or same if a forced landing becomes necessary not even with all the naval ansatal ce in the way of destroyers and batti slips to keep in touch with weather conditions and to check the observations of the flyers and hold them to a true course Evid ally the flying boat of the future if it is t become a commercial proposition for the become a commercial proposition for trans oceanic flight will have to be a mu h stronger and larger boat, with a wider margin of safety in the matter of its radius of action

As w go to press, we learn that NC-4 has o n pleted her flight to Europe by a non-stop jump from the Ascres to Lasbon Thus to the navy goes the aerial blue rib-bon of the Atlantic The first to hold this bon of the Atlantic Ine may be condition may she long retain it in the fierce comp tition, which even now has bigun and promises to captivate the imagination and stir the pulse of mankind for many generations

# Grain Bmder Troubles (Continued from page 807)

(Continued from page 507) are cross the bill hook. Thus a knot was teed in or e end and the twice remains on the lill (b). A band may be found lying with a discharged bundle, there being a 1 see knot in one and of the string and the other end being cut acquarely off. In this case the twine disk beld the twine until the knot was nearly completed, fluit one end of the twine single out of the disk just before being made a part of the knot was not provided in the local control of the little of the local control of the little of the local control of the

nre other end being out squarely off. In stopping, the trouble is with the dog in the case the twine disk beld the twine is the binder-head clutch. When she wip until the knot was nearly completed, flut are releases the dog stop, a spring beltied disk just before being made a part of the which the dog should force is the engages the disk just before being made a part of the which the day should force it is engaged. # WALTHAM THE SCIENTIF ICALLY BUILT WATCH

THE
FOREIGN
BUILT

# Know Something About the "Works" In the Watch You Buy

IF you open your watch and examine its mechanism, you will find it consists substantially of two supporting plates, between which is mounted a gearing of meshed wheels to take care of the movement, recording time. This is called the train, which we will speak of in our next advertisement.

The lower supporting plate in a Waltham watch is the foundation upon which every unit revolves and is fixed. It is based with minute holes to take the pivots, screws, pinions, etc.

This lower plate is drilled and threaded by one of the most exclusive and wonderful machines ever designed by the genius of man—an exclusive Waltham invention from the master-mind of Duane H. Church.

Many operations are accomplished with such methodical, automatic regularity that one instinctively imagines that a marvelous human brain guides the extraordinary operations of this machine.

It makes every operation (and there are 141) with infinitesimal exactness to the ten thousandth part of an inch—flawless, beautiful in its complex simplicity—every plate a replica of every other place, proving Waltham standardization to be one of the miracles of American mechanical genius.

The plate of the foreign built watch is subject to the variations of him is placed back to variant area and models without process especially to the power which they are contain, which pers are made closed here is every source, and with the person of the

So when you buy a Waltham watch you are assured of a mandardination of quadrand leadership which has placed the Waltham watch be the partial of the placed.

The object of this journal is to second accurately and lucidly the latest scientistic mechanical and industrial news of the day. As a weekly jural it is in a poss tion to announce interesting detel pments before they are published elsewhere

The Edutor is glad to I we submitted to him timely articles suitable for these columns especially when such articles are accompanied by photographs

# Three-Year Naval Program Abandoned

L are gratified to note that in his testimony recently given before the House Naval Affairs Committee the Secretary of the Navy an nounced that the second three year naval program had been abandoned The SCIENTIFIC AMERICAN Was strongly opposed to this program on the grounds that it was both inexpedient and unnecessary-inexpedient because it would tend to destroy the excellent feeling which had sprung up between the United States and the Allies as the result of our participation in the war un necessary because the joint effect of the construction of our first three-year program and the elimination of the German fleet had unabled us to reach that strong position as second naval power which the great nationa movement for preparedness had set as its ultimate goal

Mr Daniels frankly admitted that the proposal to launch a second three year program was intimately related to the fate of the proposed league of nations and he cannot complain if the people of the United States believed that the movement was based more upon the political situation than it was upon the material and military needs of the United States Navy From the very day of the surrender of the German Fleet our Allies favored a policy of naval retrenchment which rendered the big-navy threat unnecessary. However the fact that the second program has been abandoned suggests that the (suvernment is satisfied that the eration of our Allics both in the matter of the league and of naval disarmament is well assured. If these great results have been achieved we believe that the whole nation will join with us in recognizing that the Prendent has perfurmed a great and noble service in the interests, not merely of the sorely stricken world of today but of humanity at large for all time to come

We have been asked if the SCIENTIFIC AMERICAN believes that the United States should possess a powerful Navy Most certainly we do and for ever a quarter of a century, as our files will show we have endeavored to awaken the people of the United States and its Congress to the necessity for building a Navy commensurate with the ever increasing population wealth and responsi bilities of this great republic. With the completion of the 1916 three year program we shall be in possession of a magnificent Navy greatly exceeding in power the Navies of the next three leading naval powers

And just here we wish to speak a word of caution It would be disastrous in response to the call of the country for a rapid demobiliration if we reduced the personnel of our Navy too greatly and returned to that state of undermanning and shortage of officers which obtained before the war. A ship half-man under officered is less than 50 per cent efficient A ship half-manned and fore let us see to it that our splended ships the latest of which are superior to anything affoat have every ad wantage that full crows and a complete staff of officers can give them

The 1916 three-year program which called for the construction of 10 dreadnought battleships 6 battle cruisers, and 10 scouts with a number of destroyers submarines and muscellaneous traft, was neglected dur

ing our participation in the war in favor of destroyees and other vessels suitable to meet the submarine of-feasive. It is that great program which the Secretary now wishes to push energetzeally to completion

Of the battleships, four, of 32 600 tops, are under construction These ships will mount each eight of the powerful 16-inch guns The other six will be even larger and mere powerful On a displacement of 43 209 tons they will mount 12 16-inch gurs and they will have a speed of 23 knots. They will be 684 feet in length, 106 feet in beam and their mean draft will be 3d feet These dimensions are for a battleship enormous at full draft they must displace over 45 000 tons

The six battle cruisers, 850 feet in length will carry eight 16 inch guns. The efforts of the SCIENTIFIC AMERICAN to have the original design changed so as to bring all of the hoilers below the pretective deck were successful and the modified plans show all the boilers be low the waterline As a compr mise on the debated question of building composite ships we suggest that the armor protection should be raise | 1 12 inches and the speed reduced to 32 or 32 knots

The 10 scouts should be built with all possible dis-Our navy possesses not a single scout of the fast type that did such fine work during the war

## Our Links with the Past

THE avalanche progress of a sonce in the past centuries justifies a most spinnisite attitude with regard to the prospect of future developments Nevertheless there are certain sp in kinds of problems the complete solution of which presents difficulties of an altogether peculiar character su is that we may well hesitate to extend to these the same confidence of succossful attack which we justly entert un towards other

subjects of scientific enquiry

Historical problems in particul r are thus baffling in character The time-worn face I the present has betrayed to us many a story of the pust written by the hand of man foresake us the archaeologust and the geologist have taught us t decipher the writing of nature upon the rock. The cut ry logist has filled in further details by his discovery that the development of the living organism from germ to adult stage epitomises in abridged form the history of the race. The ast perhaps can claim the greatest accuracy in his recon struction of the past as he is entitled also to our ad miration for his wonderful power f predicting certain future events

But after all the knowledge thus obtained is a mere patchwork of fragments in which the gaps far outweigh the positive data. Consider only our knowledge or perhaps we should rather say our comparative ignorance early history of our race and the descent of man

What consuming interest would attach to a reasonably complete album of our ancestors! Let we have to be satisfied with a skull here, a law brue there a few ornaments entombed with their erstwhile owner a primitive carving or the work of some prehistoric painter genius, the residues of a camp fire, and such relics as these as the evidence from which imagination and scientific reasoning must piece together here a chapter and there a chapter the early history of the human race

Nor does it seem as if in this matter the progress of nence could ever greatly help us More and more will undoubtedly be learned of the past But the number of fossils shrouded in the earth s crust is necessarily

Only a diminutive portion of all living beings leave recognisable permanent trace after their death. Unless science should discover some altogether undreamed of new method of unravelling the past most of its pages must remain forever sealed to hum in ken

And it is not the gray dawn of our history that is thus sunk in oblivion Some memorable treasures of the very near past seem forever lost to ur possession What would not the lover of music give t hear the strings of a Stradivarius respond once more t the magic touch of But science with all its accomplishments is impotent to restors the voir that is still

From the discouraging task of resuscitating the dead past we may with advantage turn our energies into the more frustful channel of preserving for future generations a competent record of the present And here modern science comes readily and abundantly to our aid Not that elaborate means are always required to fulfill the purpose Much can be done by very simple means. This in-difference of past generations to health this in-setcending. When we reduce how simple a matter it is lo renounting or near we recent now simple a market of \$30 keep a family chronicle, it seems absurd that it should regenerations hack Modern scientific intensity in the second to trace relationship, to say nothing of hereditary traits, a few generations back Modern scientific intensit in the laws of natural mheritance and in the suganic move based thereon should result in improvement in this matter But perhaps more effective than any atten matter But perhaps more effective than may to persuade people to give attention to these things is the direct assistance afforded by photography Until about one hundred years ago the possession of tolerably good family portraits was the privilege of the fairly well-to-do At the present day not only is the family photograph album within the reach of all, but even for the favored few who can afford to retain the services of an artist it is very much a question whether any but the great masters of portrait painting can equal the work of the camera in the hands of an expert And in no case does the artist s brush offer the same guarantee of faithful reproduction which is afforded by a first-class

More elaborate and refined means for preparing recorof today for future generations are given us in the phonograph and the moving picture. For obvious reasons these have been employed rather for recording events and performances of national importance than for the satis faction of the private individual, although they offer attractive opportunities in that direction also, and there seems to be presented here a promising field for future commercial exploitation

A matter which seems to deserve more thought than it commonly receives is the question of the permanency of the records laid down in our libraries. That paper m in a general way admirably adapted as a vehic historical records is fully attested by its universal use for many centuries Unfortunately it is a rather perish able substance liable to be destroyed by fire Another problem in this connection which somer or later must assume serious proportions grows out of the accumulation of printed records What will become of our libraries in a few hundred years' time, at the present rate of publication? Today this may be an academic question, but it is difficult to avoid the conclusion that some day, not perhaps so far removed serious thought will have to be given to the problem presented by our ever increasing library stacks

# Determining Direction and Velocity of Wind Currents by Signals from Balloons

GENERAL BOURGEOIS of the French army recently made a report to the Academy of Sciences concerning the services which the use of explosives may render to the science of meteorology by aiding in the determination of the direction and the speed of the wind, by means of the indication given by the sound pro-

Both in the artillery and in the branch of aviation it is very important to know what currents exist in upper portions of the atmosphere as well as their direction and their strength. This is determined in the daytime by means of sounding balloons, but the use of these must be foregone at night and in cloudy or foggy weather Heace the following method was devised A halloon is sent up containing torpedoes so arranged as to explode at regular intervals. Thus the balloon can still be heard and its whereabouts thus determined in spite of its having become mysuble. The explosions are registered by apparatus which enables the points in space, at which they take place, to be calculated Thus the trajectory is marked out by a series of points by what may be is marked out: oy a serves or points oy wase may be called a series of acoustic signboards just as it a marked by a series of optacal signals in the nosthod of sounding by means of theodelite By the totality of the horizontal projections of the bursting points and the knowledge of the time which has slapsed between the explosions, the speed and direction of the wind between the skittides at which two successive explosions take place can be readily

During the war the results obtained were entirely satisfactory both to artillerymen and to aviators. It will be desirable, therefore, to continue the employment of a method which permits the exploration of the move-ments which take place in the troposphere.

# Navel and Military

Meaning Towers for Birigibles.—The ship of the are must be preserved from sonatest with the ground just on equility to the ship of the son a prevented from touching believe. The many cases in which arraings have been wrighted when upon the ground proves that the only safe way to sachor on singular just no moor her hand on to a larly mooring must er tower file would then risk head-to-wind just as a ship rules head-to-sac when anchords.

One Leasest Breadmought —Our leasest draudnoughts ——"I war" and "Manasonhaste"—will make a great advance in size and power over any provinces warships and their insight will be 604 deep, these breadth 109 foces, and their mean draft will be 38 deep. The motive power will be similar to that of the "Mession," that as to say they will have the sleetine drave. The maximum speed will be 38 lands and they will have as crussing radius of 8 000 miles. Their displacements will reach the unpresendanted figure of di-500 toos. The argament will consist of 13 behas pure and 16 4-inch guana and 16 4-inch guana.

18-tend gain and 19-tende gain.

Find Oll Rooseway.—As showing the advantage of oil faul in merchant shaps, A. P. Allen of the flusping Board draws statution to the mercand carpenty resulting from the substitution of oil for each True, in a 15,000-tend indevelopt shap, this increase is 800 teles of eargo on a 7,000-main veryase, which at 850 ton means a energy of 840,000. Deducting from this the higher cost of the dil over each of 38,000, there is an advantage of \$87,000 even a cost-burning shap which is sufficient to pay for all the fuel used on over two and one-half vorrages.

Artillery Ammunition Returned from Franco-According to the Army and New Journal, the artillary ammunition received in the United States from France from the following of the arealston to March Sint natheauthe following 75 mm altragon, 2,558,000 rounds, 75 mm IR IS shell, 934,183 rounds, larger enhours, 512 rounds Fagures summaring these returns by formage are not yet available for recent mention by domage are not yet available for recent mention that the total returned during January ammunied to 60 446 short toos axeleding Franch replacement sized Of the total S1,177 toos were artillery and small carries ammunications.

The League Would Rule the Sea.—Commenting on the suggested assumpty for at least one navel power medicals in the League of Nations to possess a first equal to that of Great Britans, a writer in the League Three shows that with the League of Nations against her Great Britans could never preserve communications with her deminions. It took 50 Britals and Allied erments to round up a doesn German cruzers which had no hears to fall beak upon but in a var with the League course of fast wandlips based upon widely distributed and defended ports, could paralyze the overseas commerce of Great Britals and sterve the nizands into str

Army Ordanane Policy — Ihe plans of the Chair of Ordanane for the manufacture of ordanane material are based upon the probable requirements of exclanatation of guess and recuperators ? Smillton for the prodution of guess and recuperators will be manufacted to a capacity ample to meet future requirements but very small facilities will be maintained for the manufacture of gue earliages and gue forging, mass these out be obtained by regiol medifications of exacting commercial plants without any aerious closey. A body of skilled mm vill be maintained at the government areanals who in case of emergency can be distributed among semanancial plants.

The "Hedge" on Torquele Pretection.—Draing the war a forcetic segmention of invisions for the probasions of ships against the torquele, was the torquele space of sides against the torquele, was the torquele pretection being generally supposed from the skip head by means of bostons and then "The "beings" or "blines" which provid no suncessful on the monitors in reality as agglication of this jobs. Bejarstie placing, is was found, could not be abled in places, aggregately in heavy weather but in the "bliness" the placing in brought at a the top and hotten, and amonged with the circulary of the buil into one distinguish whole. Amongian of the circular of the buildines of the "bliness" they are part of the acquirement of the "bliness" test part of the circular of the buildines.

#### Science

Dr. Hessilton Rice of Boston who has ind many the line experiment in far-away lands starts this month on his suth journey of exploration in Bouth America He has built a \$4-6000 launch for navigating the shallow waters of the upper Amazon. The vaces which contains ilving quarters and a laboratory has a draught of only 30 melan.

Temperatures of Pavensents in Hot Weather The hot personant" which fairness in the typical description of city weather in the degedays deserves its bad reputation, according to an article by Mr. (\* h. Paton in the Bupassering Neur-Berowl reporting the results of thermometric readings made on August 6th and 7th at Riversida 20 miles from 6th Am to 10 V M at the surface of these types of pavensar also one foot and four fact above the personnent and over adjacent laws discussed to the personnent and the surface of these types of pavensar also one foot and four fact above the personnents and over adjacent laws discussed in the surface of the surface time of the surface in the surface of the

Studies of For-Silmal Machinery—In a pamphlet recently sensed by the Honorary Advasory Council for Scientific and Industrial Research in Canada Prof. Louis Sessimize and parameters research in Landau Y King of Mooffl University presents a preliminary report on the excitentely valuable investigations which he has been carrying as for some years in regard to the operation and efficiency of for-signal. The type of for-signal most fewered by the Canadian authorities in a fog-signal most fervess by the America nature as the modified form of spinpressed are stress known as the "displacest" Although a great many experiments have been made with apparetus of this character, actual measurements for the event at various distances from measurements of the sound at various distances from the sires and under various conditions had been lacking the sires and under varous conditions had been lanking until such measurements were made by Professor hing at Pather Pount, Combon, in 1913, with the and of a "phonomente", devined by Prof A G Webster of Chieft Interventy A harps amount of new information was thus obtained concerning the behavior of sound in relation to meteorological factors especially wind in relation to measuragest active superanty with an education of the well-known milest some which have been responsible for many marine disasters Professor King also devised a method of testing the "accusate efficiency" of the aren 1 e the actual proportion of power converted into sound. It was found that under normal conditions the output of sound was only about eight per cont of that which would be emitted from an ideal stem in which all the energy of the com-pressed air was utilised in the production of accounts After an interruption due to the war experi ments were resumed in 1917 Accustic surveys were carried out on a more elaborate scale in conjunction with meteorological observations including wind measurements at various altitudes made with pilot balloon arrensom as various attitudes made with pilot belicous A new inse of respects was also begun vas a stuct of the quality of the signals given out by the displace Prof Dayton C Millier, of the Case School of Applied Science, jound the party at Jather Pouri branguly us ham his inganasius "plessocials which makes a pht o-resplan record of segand waves and enables an assurate while the contract of the contrac analysis to be made of the purity of the sound analysis to be made of the purity of the cound of the relative propositions of accuste energy constant of the fundamental and the swartones. The descript made that the kigh erustones produced by the same do not travel for through the atmosphere, and therefore responsely a west of energy. Hence in designing areas the appearance of the state o the stipuspis should be made to concentrate all the energy, as far as possible, into the fundamental tens. Thanks to all these spaties, it will now be possible to place the construction of depositants and of survers as general, meledding these used on shipboard on a tenty scientific basis. It will also he possible to constructs portable appearator for use in testing for-quants.

## Automobile

Lubricans Testing Machine —A device has been constructed by an automobile amanufacturing firm in its own shop for testin, the properties of lubricants The machine is built on the following lines. The shade part is a pendulum hung is a bearing which is support it on a shaft rested by m and of a pully. I he bearing is compassed of tw. ir so a t. which pressure into be applied by a spring apring insuit if the produlum. The pressure regulation is official by a milled head series When the shaft is restated the fir tom between that and the branes causes the pendulum to at their accretion runting of degrees out of the vertex of an it is distant and the branes causes the pendulum to at their accretion that is the pressure on the jurnal jury an indication of the first ton. Fortice is refused by which the pressure on the jurnal jury an indication of the further from which the first ton first ten yellow you have for the first ton. Fortice which the first ton first ten yellow is the further and the pressure of the first ton first ten yellow 

Meaning of Piston Speed - lhe factor that limits the piston stroke and makes the speed of rotation so dependent upon the travel of the piston is piston speed Heretofore it has but it considered describle in it to exceed s speed of 1 000 feet per minute which has been de med to make for greatest off came, combined with andurance by many auth rities on design and construc tion of internal combusts is in store During the past fow yours there have been instances of engines that were giving satisfactory service with pistun speeds of 1 200 to 1500 feet per minute and in some automobile and aviation engines the piston speed may attain values of 3 000 feet per minute without power losses due to undue mercare of internal fri tion I ubrication is now the main factor that determines piston speed and the higher the rate of person travel the greater the care that must he taken to ins me proper ciling

Valve Operating System Depreciation -The only remedy for wear at the various hinges and bearing pins is to bore the holes out slightly larger and to fit new hardened steel pins of larger diameter. Depreciation between the valve plunger guide and the valve plunger is usually remedied by fitting new plunger guides in place of the worn ones. If there is sufficient stock in the plunger guide casting as is always the case when these sembers are not separable from the cylinder casting, the guide may be bored out and bushed with a light bronse bushing A common cause of irregular engine operation is due to a sticking valve. This may be due to a best valve stem a weak or broken valve spring or an accumulation of burnt or gummed oil between the valve stem and the valve stem guide. In order to prevent this the valve stem must be smoothed with fine emery cloth and no burn or shoulders allowed to remain on it and the stem must also be straight and at right angles to the valve head If the spring is weak it may be strengthened in some cases by stretching it out so that a larger space will exist between the coils. Obviously if a spring is broken the only remedy is replacement of the defective

Optimistic Trade Reports - I he success that has attended every automobile show held in the country has greated great optimism in the automobile trade The ban placed on production by the government pro vented any accumulation of cars and because of the scarcity of automobiles the increasing demand even though many prospective car owners and drivers are still in the service is so large that no difficulty is experi enced in selling automobiles During the war the men handling motor cars had a hard time as there was a shortage of expert labor that made giving adequate service out of the question Many people who buy new cars annually retained their shi machines last year and as a consequence are in the market this season. The accessory business is also showing ugns of improvement This is especially tru of the tire trade as the past open winter kept many cars in use in the Northern and I astern States that would ordinarily have been stored for the severe winter weather so a much larger number of tires wore out than would have been the case under normal conditions There seems to be no immediate prospect of a drop in prices as the present supply of cars and their components will not keep up with the demand. The opinion of those familiar with the trade is that there will be considerable revision of prices when the care f : th 1920 season are offered and considerably mere compethon than now exuts will be noted at that tim

# The Carrier of Malaria

# Museum Models Which Reveal the Structure of Anopheles Maculipennis

THI malarus mosquito though no new problem institutes an ever recurring the Evity summing heat they post with us and every in mir we are obliged. to wage all over up a the war upon lam. Thus year the suit; it is erves und is no fact receiving more than the usual atsoldiers in the comps we are confronted with a series of artificial and highly o centrated seats of possible infection which the conditions f living while w het to the closest ontrol are very far from those of ordinary civilized existence and therefore likely to lead to all sorts f and therefore likely to lead to all sorts. I sanitary troubles despite that control. It the same time we are putting forward a project to grant moccopied lands to our returned soldiers which involves consider shie danger. Such land as is available for this purpose is of necessity land which has not heretofore paid the cost of reclams tion. This necessarily means that it is land on or about which there is an unduc-

ising on or about which there is an undu-preponderance of water. In result nt of Florida or the Mississippi Valley may be sufficiently acclimated to survive the conditions which surround him the man from New Ingland or the Northwest suddenly and without preparation set down it these conditions must includely

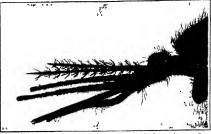

The scourge of malarm is as old as history itself As early as the fourth century
B ( there are indications which are now accepted as authentic of malaria epidemies the disease is consided to have been a potent cause if not the dominating cause in the decline of the Grick evaluation. The ancients could not combat this up. neen for because they were ignorant of its nature. As the name indicates they imagined that the attack cum from the air—preferably from the night air which their fancy endowed with all sorts of evil qualities It was not until 1897 through the discoveries of Ross and others that the life history of the malaria parasite became known, and of course even now the old ideas prevail in many uninformed quarters With our present fand of knowledge, intelligent defense against malaris is feasible and this year of all years, when so much is dependent upon the health and working efficiency of the nation, the subject is being given particular

Malaria is transmitted by certain me bers of the mosquito family Since this discovery was made mosquitoes in general

some 40 different spe-United States alone

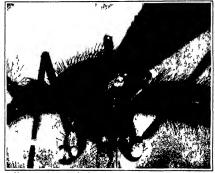

They range as far north as the Arctic Circle, and in Maska Greenland and on the tundras of Siberia, where other meet life is scarce, they constitute a terrible scourge Explorers tell tales of the mosquitoes on the snows of the har North which make the misded ds of the Jersey variety seem tame и сотралион

Mosquitoes in general are good travelers, though pos-sessing little power of self-locomotion or even of self-direction. Like the old style balloons, they go when and where the wind listeth, and, with a mild and favor able brocse, they will migrate to 35 or 40 miles distance from their breeding places They vary in size from one-sixteenth inch to the huge Jersey "Gallinippers ' of half

Head structure of the female meaquite, which does all the damage in connection with malaria propagation

While any old kind of mosquit is a nuisance to have about the place it is fortunate that they are not all pathogene. In fact, of the 40 American varieties the

Museum model showing head detail of male or suck blood

that overy was made in nonjunous in a naria have reserved a good drait more attention than before, and new species are constantly being found. Although the meet in question is a tropical one it is by no means confined to the tropics, and the special one is to by no means confined to the tropics.

one 40 different spicers having been although the meet in one of the provided wing measuring been although the meeting of the provided wing measuring the right provided in the position of the provided wing measurement.

Mosquito does not bite, his bill

scussion will therefore be confined to

Mr. Mosquite does not bite, his bill is so blust that he could not be a blood-sucker if he wished It is Mrs. Mosquite who does all the deadly work of fever propagation. She is meet active around dawn and after enuner. She avoids strong light and prefers dark colors she is cascattailly a domestic creature, staying around. Busses by preference. In the example of the control of the colors of the control of the colors of the colors of the colors. The colors of the dark corners of cellar and garret, and on the first warm day of spring are out laying their eggs. Save when extended by the arrival of this hibornating period, the life of the female is one or two months, the main, on the other hand, lives but a few days. The food of the mosquito is the juste and nectar of plants, and of course juste and nectar of plants, and of course map, animals, reptiles, and even cater-pllars are butten with the same freedom.

The female mosquito lays from 50 to 100 eggs at a time, on any quiet bit of water In about three days they hatch, and though at first the laws is very small it grows rapidly and attains full development in a

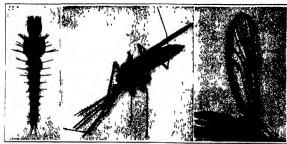

few days We have then the familiar wrigglers of the old-time rain-barrel and

the uncovered castern In this stage the larva must have air, which it breathes through a siphon tube located near its tail. The normal position of the little animal is just below the surface of the little animal is just below the surface with tail pointing upward I is as this time that the presence of an oil film over the water of absitation is fatal to the young mosquito, the oil clogs the siphon and the larva suffocates This is by all odds the simplest and most effective way of destroying mosquitors I is a simple because the problem of locating the pasts is an elementary one. It is effective for the an elementary one, it is effective for the same reason that prolonged immersion in water is an effective way of destroying a

During the larval stage, which lasts from seven to 14 days, the malarial variety can be distinguished from all others, by can be distinguished from all others, by the curiously inclined, by virtue of the fact that it lies with its body parallel to the surface of the water, while the other species hang with their heads downward. When hang with their beads downward. When the larva is ready to graduate, a T-shaped crack appears in the skin of the heads, from which the pups energes The pups rumans in the water, but does not eat the pups abel. As is the case with so many other meeting in the adult mosquito. The most critical moment in the the life of the mosquito is when it emerges from the pups shell. As is the case with so many other meeting the pups abel. As is the case with so many other meeting the pups are not hard or dry enough to the pups are not hard or dry enough to

fly at once, and the creature is easily upset and drowned In this way the flow of tide-water into marshes where

water into marshes where mosquitoes have bred kills great numbers of them great numbers of them to the same the same to be recognised three major parts. The head, the thorax to which are algorithms and the same to the same thousand simple eyes or facets. This enables the mosquito to see in all direc-tions. In front of the jaws tions in front of the jaws are two branch-like growths with 15 or 16 joints, and at each joint a whorl of fine hairs. These are the antennee, or organs of heat Beneath as the proboacis tool-hox First comes

Models of the malarial mosquito, showing a view of the larva from above, the adult female, and a detail of the wing

labrums, the mescutto's drill, a long implement with a greove on the usiger side through which the blood of its pays is sucked. Next comes the hypopharyar, a thin blade which can be closely applied to the under side of ske labrum to forgue a closed channel for the passage of the sucked blood. The hypopharyar has a fine tubular channel of the own leasties, and it as through this that the makanis sposes enter the body of the hone. At the two called and body the labrum are two pairs of sineder isnecillar instruments with spear-boad points. These also enter the wond and help to brace the mosquitor is nead what its owner is enjoying his meat. It is the the third which it owner is enjoying his meat. It has been the form of the control of the various organs and protect them while not in On either side of the probosus are the maxillary

use On either side of the probosus are the maxillary papers or organs of touch. The body is composed of three rings, the middle one bearing the wings. The latter are so very thin and delicate that they practically reliuse to make any impression on the photographic plate, gave where they are reinforced by ribs covered with fine scales. The arrangement of these ribs varaes with the species, in the makinal variety there are four black spots on each wing which give rise to the name machingman already which give rise to the name machingman already.

The legs are hollow tubes with the muscles inside They are connected with the body by the coxel or hip-joint This joint al-

lows great flexibility of movement, and is altogether a very creditable but of encreditable bit of en-gineering design. The mosquito has three pairs of legs, of seven joints each. The hindermost pair is not employed in walking, as may be readily observed, but acts to balance the insect in flight and as an organ of touch The mosquito has two pumps with which his ex-tracts your blood, and when they both get under way you are relieved of a large drop of blood and moculated with a goodly colony of malarial spores in less than a minute In view of the great timeliness of

great threliness of an discussion re-garding the malarial measurito and ways of meeting its ravages, the American Museum of Natural History has installed an exhibit consisting of large models of male and female mesulipennis, together with the viruous stages in the development of the soult insect. It is from the models that the photographs shown herewith are taken

# Microscopic Organisms in Drinking Water

A RECENT experience of the water company that supplies the villages of North Tarrytown, Hastings, Debbs Ferry, and Roardalo near New York, brings to mind the manite disturbers of the peace and well-being of the sommunity, that may lurk in water apparently pure and underfiled

of the community, that may lurk in water apparently pure and underfiled
During the past few months, the water furnished the consumers by this company had a very diagreeable taste and oder, particularly marked during October Compilates came to the company per constantly, that Group the Law Person of the Compilate came to the company per constantly, that from the tap was first duantied and the mercescope due to show the presence of any organism that would account for the peculiarly unpleasant taste and amount of the peculiarly unpleasant taste and amount of the peculiarly unpleasant taste and amount as the constant of the peculiarly unpleasant taste and amount as the control of the transport of the control of the superfection that the past function of this superfection that the came of department of the came of the principal of the came of the control of the came of the control of the came of th

Synura in drinking water, magnified 1600 diameters

the reservoir to the fliter plant broke up this loose colonial organization, so that the tiny particles escaping into the flow of the faucet though still malodorous and

less to man, was put into the reservoir, and in a few days both odor and taste had entirely disappeared

This recent experience with the water supply well il-lustrates the fact that besides the larger forms of plant and animal life with which we are familiar the learest water may be teening with minute microscopi fries invisible to the unaided eye. These may be becteria arysing to the unanted upon the sum is a conternal accuracy in man deadly donase, or some now not in which has harmful form or patchance some feautful and perfectly harmless plant or animal. The balan c and relation of these forms are of vital import me. (c) public water supplies for if there is a disturbed equilibrium so that any one of these organisms is reases unduly in numbers one of success organisms it reasons that it is until in numbers the water may become us sightly ill simbling and bad tasting. The flavor imparted by each fit these various tray organisms found in water is very characteristic like Symura found in the larrytown at 1 Dobbs Ferry water supply imparts a distinct cucumber like taste another the Asterionella gives a string fishy flavor, Aplantzomenon causes a grassy tuste. Uroglena imparts the unpulatable flavor of col liver oil. Constant war fare upon these tiny troublesome focs which insist upon taking up their habitation in our drinking water is the price of safety —John J Schoonoven

Receiving Wireless Messages on a Paper Ribbon PHOTOGRAPHIC receiving and recording of wireless messages as a matter of regular daily routine bas been carried on by Naval engineers for some time past, at the Otter Cliffs

nest Bar Harbor pose the engineers have made use of vented by ( A Home an el etrical ngmeer of Schon-ctudy N Y This i die invention perto supplement or icplace the ear in r ading wireless tally deaf man r ceiving operator
ii a station so
equipped
The photographic

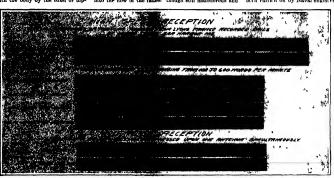

it order which is companying illustrati n makes for greater speed in rereiving greater accuracy in decipher-

mg and provides a permanent rec rd of every dot and dash in every message so received Because of the very 1 is its tuning that can be obtained and the resultant high degree of selectivity it has been found practicable to receive messages despite many inductive noises and interfering signals which ordinarily have rendered respition impossible Although the instrument is not immune from the offects of static strays it has successfully recorded messages at high speed regardless of strong state interferences that without its aid would have baffled the receiving operator it has successfully recorded messages

It is stated that messages have been deciphered with its assistance when operators were unable to get a single word of it by ear alone. I rem now on receivers do not hear by their ears alone. The photographic recorder supplements the usual method of receiving and in that manner the outstanding obstacles to accuracy in wireless receiving have been eliminated except for severe static interference

The photographic receiver with its permanent record is a guard against error and will actile any dispute, for its visual record of a message in dots and dashes distinctly shows to the eye what was received. A photographic print of this type is of unquestionable

As to speed in receiving this machine has frequently recorded at the rate of 400 wor is per minute and more recently in a test conducted by Mr. Hoxic himself the machine recorded a low power message at 600 words per minut. Up to this time the most rapid method of recording radio signals has been I v the phonograph but this must still be transcribed by car and not by the eye Moreover no permanent visual record is made.
The phonographic method has never vet approached the rate of 600 words per minute, so the new instrument has hung up a new speed record so to speak An int i sting (Continued on page 628)

Wireless recorder tase with signals made under different conditions and at speeds from 50 to 600 words per minute

stly tried out by the United States Navy

# With Trees for Ears

## A Wireless Station Within the Reach of Everybody

WIFI a pair of receivers to his saw an analysed yester to a certain radio station heard a high toned hims which changed to a low growt that the sked to the upper reaches of the musical scale in a faint vir faint bins and from timers spit incomputate had had his song made southils. In operator rapidly utering the knots on he capter and conders are, need to let as site style through the changing radio signals which were the retrieved for attention together in the receivers can cleave the reservant of the view of the receivers of the receive

of the Dutri t of Columbia and the eignule were received

or san Dustri t or committe as of the eigenise were received through an oak trees for an universe. If m not a joke nor a sensitive currenty the strange descovery of the George () Square Chief byral Officer that trees—all tree o of all kinds and all heights growing that trees all tree of all tanks and all hughts growing anywhere, were making a own works to review and an tennas opinhined. The making first tank to his attention in 1934, through the use of trees as grounds for Army busses and telegraph and talkingne sets which meanity they ground and in a day assoon functioned poorly or not at all with ordinary grounds. Bight then be biggar egy remonits with a way to nearney what possibilities, if a vy, the tree had as an arrail. But in 1904 registering hyper was fat more under violent than at present, and vacuum amplifying tubes were not thought of

During the war the 'signal Corps established a chain of spend a neuving stations in different localities to copy and raised but comp and allied rides messages. Some of thus statutus were instructed to text the efficiency of

or from as receiving antem ac growing tross as rectiving antitin as. With the rounarchale searchts amplifiers 1 on available, it was not only possible to recent signals from all the pranciple I utopean statemen literagh a free but it has developed, beyond a theory at 1 to a fact that a tree as a good a say man-mand armain parties of the size or extent of the fact for receiving and better in the respect that it brings to the open entors can fire its asstate.

response, mass it ormings to the up review area in it is submissioners.

Thus are invoid statement, yet this to be cond the condition of the Nation stands a lettle portable house, the oak teer, a small reconvey, et and a couple of exhaust mass and as officer on duty, and the cursous may such permanent, hear for thanked we that the agendals or received are neither faint nor interrupted but strong influenced dots and dashes even when they come from far-off Nauen. Page after page is copied dealy from the propagands make rail which Naum sentes out by the ream Loyeas, Poiding, ships at wa even if the NC-office on her way, are likedy flagle, and the histories of hot in the phones typing on the table. ## The Langley-Manley Engine

To the Editor of the SCIENTIFIC AMBRICAN To the Editor of the SCHENTIFIC AREBICAN
In a letter appearing an your nesse of November 90th
Mr Edwood Hayans objects to a comparison of the
Langley Manky engine of 1901 with modern aurorati
engines claiming that "The power used was steam
and therefore hunted in its caduring capacity to a few

While it is quite true that I angley did build so

while it is quite true that I angley did build some remarkable stoam modors nevertheless the particular motor referred to was not operated by steam but was of the internal combistion type II emboded such advanced sugmenting that it is propored; considered advanced sugmenting that it recovers significant to the supplier of the automobilis radiantity as Mr Hayawa should not have been sware of its sources. Many of the prendped features have some passenger of the supplier of the subdiversament.

Mr Haynes is also very mu h mistaken in his estimate of the enduring capacity of the steam engine. He has probably forgeticul for the moment that the real work of the world is boing done by the steam engine, and that there are in operation today steam plants fitted with condenses and with improved engines and ginerators, that empar is orably in fact and water economy and excell in the matter of total accipit and shirty the very best sintered embustion cagons. In comparing the steam plant with the Rocket he sp it lably realling how, in the cally days some steam in cluts has roared past condensers and with improved engines and generator him only to st p a few makes further along to repl

mm my raw in a two mass convenient stream.

The possibilities of the modern exam power plant cannot be judged by the semi-experimental outfits of a decade ag. Tor it must be runchered that the same advances in all branches of engineering that have made the modern automol is possible are also available for the development of the steam plant

## For the Motor Tourist

## What an Adequate System of Road and City Signboards Can Do for His Guidance

By Avis Gordon Vestal

N an earlier issue of the SCIENTIFIC AMINI IN the Editors have permitted me to retail the results of my observations regarding the adequate blazing of the motor highway The suggesti is with I made there and the prin iples which I laid down had to do with but one aspect of the case. The tourst wants to know what road he is on and he wants assurance that he will be able to stay on it till he reaches his destination but he wants a good many things boudes that Some of these wants are more important than others but I think if you will bear with me while I catalogue them

you will agree with me that they are all worth meeting in the first place let me suggest that it is a wee bit egotists al fer a town and especially a small one to take exotistical for a town and operally a small one to take
the granted that all when riche throw when they are
that was all very well in the data when hay motors
that was all very well in the data when hay motors
that one of the commence of road transportation and
the state of the transport of the transport of the transport
together of the neighbors. But now the
proded tournag are tale as per ple hundreds
and thousands of miles fr m hun. The
say and the outsiders of the village Slow

The down to umpty-ump miles per hour shows that the inhabitants know the gas shows that the innaniants know the gas buggy is abroad in the land. Why not add the name of the town with perhaps a word of greeting as Wel can to Hamil-ton? I have driven through countless towns where the name was not to be found even over the post office! Of course one might sometimes make deluctions from the signs over stores but if these were always to be relied upon there would be a good many more Bostons and Armes scattered over the countryside than the map indicates. In my observation the cities along the lincoln llighway are particularly careful to introduce themselves to the stranger at their gates.

selves to the stranger at their gites
It would not cet much to add a few
pertinent facts of interest about the
method of the stranger and the stranger and

Salt Lake east to Omaha The Highway from Ely to San Francisco has been marked permanently by the California State Automobile Association. It is by such cancerns state Automobile Association. It is by such persistent action of the hydroxy associations and the various local and general automobile bottee that adequate provision for the marking of all our routes must event unly be made.

## Making Safety Islands Safe

TWO important purposes are served by the parners known as safety slands—traffic is controlled and pedestrians are protosted On much traveled; boulvards, lines of traffic, are defined and confection

the thoroughlare without danger of being run down. If all motor care were well run, almost only easily seen signal would be sufficient to allow the pedestrain to pause in safety. But prefettion must be afforded against the ricklossly driven sationolula and the machine that is not under control. This makes increasing a substituted lawner that the proposed in the control of the proposed proposed in the control of the proposed proposed in the proposed proposed in the proposed proposed proposed in the proposed prop automobile and the machine that is not under control. This makes accessary a substantial barrie, the biss of which should extend well below the pavement surface. Otherwise the cutire island may isplaced when struck by a heavy car There is the temptation to assume that in any case here a car runs upon a safety island, the driver must be

where a car runs upon a sacry issued in a diver must be at fault. This is not necessarily the case, and the as-sumption that it is is an unjust one. If a chauffeur can not see a sidely island he cannot be expected to avoid it. It is unfortunated that interest in these islands is too effect. dropped with their installate a so that seldom has much thought been given to making them really safe for motorists as well as for padestrians. It has too often been overlooked that islands so shaped as to ward off vehicles striking glaneing blows and so illuminated vehicles striking gianting those and so minimized as to be plainly visible especially at night are a prime necessity. If these are to be true islands of safety rather than sources of din er improvements must return the control of t made in their design which will cause them to be more

is minimized by safety islands at inter-sections. Every driver knows the path which will be followed by another car turning in or out or crossing, and reckless

chauffeurs cannot pass over to the wrong aide of the drive at these dangerous points of intersection with other streets

Morcover provision must be made so that pedestrians can stop at the center of the thoroughfare without danger of being

be made in their design which will cause them to be more plantly wishle, and as narty collisis a proof a possible. At bows intersections on frequently finds lamp. At bows microscients on frequently finds lamp. It is a proper standard on the plantlers which we have a proper fraquently trivial there is always the possibility of fraquently trivial there is always the possibility of strong many to the occupients of these are of the island. Some idea of the frequency of these accidents way be gained from the number occuring at 17st islands under the jurisdiction of the South Park Common ones, from nor Parkays of the 44th to 200 entires comparfrom mere breakage of the glabe to complete demolition

from men breakage of the globe to complete demolition of globe, post and vort the platform itself.

Most accidents at sifty shands occur at might. Its hed globe contours at these points furnishes but dim illumination so that it in v.l. impossible for the digits of the platform. And thoughout the set the extract of the platform. And thoughout the set the driver may fed citricity is set the danger signal if the supporting post and the island hos are userly institutionally and the supporting post and the island hos are userly institutionally and the supporting post and the island hos are userly institutionally in the dark Attempts him been made to go in the transfer of the control of the co

Adequate thiunnanton of the base with white light is
the needed remedy. Small lights placed just below the
red globe if shielded by reflectors open at the bottom,
will make clear the size and shape of the platform without blinding the meterial. Greater visibility will also by the use of white island posts. Black be secured by the use of white aland posts. Black posts at safety islands were painted white last year by the two commissions having charge of the majority of parks and bouldvards in Chiraca. On the South bade both the lamp-post and the platform have been made white while only the post has been painted at the islands under the jurisdiction of the I me of a Park Commissioners. The platforms here being of contrate, were judged to be sufficiently light-clored and its week of the property of t pure white post

## Concrete Data

A BULLETIN recently issued by the I mipressive, tensile and transverse strengths and other physical properties of dense concrete vary with the per cent of cement used in the preparation of the concrete, and thereby enables the designer and the builder of concrete structures to effect the greatest possible economy in the use of concrete by requiring the fine and coarse aggregate for the concrete to be mixed in such propor-tions as will secure a dense mixture and adding only such a per cent of cement as is necessary to produce the strength or other physical properties desired in the concrete This bulletin is for free distribution on application to Publications (ommittee, University of Texas, Austin, Pexas

What happens when the safety island is not properly visible

## The Wireless incendiary

## By Jacques Boyer

I N certain cases radiotelegrams provoke fires from a front harmonic fine fart has recently been confirmed from the viry interesting superiments of M Gerga A Leroy. This chained as the result of several judicial examinations entitled to him, in which the disastrous effects of fire could be attributed to no other cause than Municipal Laboratory at Rouen He revealed the mis-Municipal Laboratory at Rouen. He revealed the mis-deeds of the wireless ly means of an apparatus which he has christened the igniting resonator shown in our photograph

photograph

This as set up for M. Leroys exportments consists, first of a glass bulb with four speciatrics one at each of the four sides as shown in the cut. Introduced the two lateral orifices passes and it trode of brass and these electrodes earry mur meter a rice with the eigener with coment into that form the intrinsistance of the boles. These electrodes are bored at their mnor extremities to receive subsidiary electrodes of platinum, copper from brass or carbon in various forms while the outer ends are attiched by means of a thumb-screw to a loop of copper wire from balf a yard to a yard in diameter. In brief M Leroy has designed this system to be oper-ated as a resonator of the classical Hertz type but with the spark occurring in a closed vessel in contact with various inflammable substances which are there submitted to test. The upper aperture in the vessel is closed by a stopper through which pass a manometer a thermometer and a drainage tube with a cock it the lower opening gives passage through heavy packing to a wire that supports inside the vessel a light table of mice on which are placed the inflammables for test also to a second drainage tube with a cock, which

meets the upper one already mentioned

The entire bulb is immersed in a bath of oil of vaseline, itself onclosed in an inverted bell vat Heating is accomplished by aid of incandescent light-bulbs, the points of which are broken off after immersion in the oil in this manner the internal vacuum of the bulbs draws in the oil, and the current thus produced in the liquid enable the experiment; to vary the temperature of the test at his will. When it is necessary for this to exceed 50 degrees (Centigrade) the glass bell is replaced by a less fragile receptacic of sinc or brass.

On the other hand the drainage tube communicates.

the surrounding air which is introduced into the builb by an aspirator attached to the tube Finally, ance the good Rouenese chemist proposed to study the phenomena of slow oxidation and of latent combustion which can be manifested by certain substances, he evaluated these items according to the amounts of car-bon dioxide liberated. It was therefore, necessary for him to purify the air, and for this purpose he added to the experimental apparatus discribed above, tubes containing potash or sods and sulfure acid or calcium chloride in order to free the air at the beginning of all canonical in order to tree the air at the origining of artraces of carbon dioxide which it might contain. Den he passed the gaseous current that energy from the bulb through several other vessels containing baryta water. The quantity of barium carbonate formed enabled him to

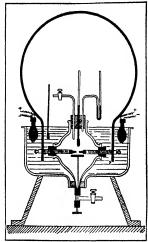

of the quantity of the slow combustion.

Once this sguiting resonator was ready for action, M. Leroy projected upon it feeble Hertsian waves producing these by means of an induction coil with a

d meulator injected in the This transformer receives at vacuum the primary a maximum intensity of some the primary a maximum intensity of some 20 amperes and gives a secondary spark of 45 or 50 cm, it operates with continuous current from the city service, which is interrupted with a mercury jet interrupter. As condenser of the oscillating crouit, he utilizes simple sheets of window glass covered with tin foil suspended vertically by means of glased yarn, and presenting a quadruple armature of surface I motor by 14 meter A large, flattened metallic wire and a double spiral of 50 cm diameter constitute the transon antennae as shown in our photograph

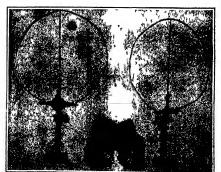

This rudimentary apparatus enables the skilled experimenter to show without doubt the incendiary action of the Hertsian waves, although their electric intensity is a minimum in comparison with the power of the large wireless stations now in service In particular M Leroy has set up at some es dutance inflammation of combustible materials such as guncotton, tinder, stone materials such as guncotton, tinder, cotton, worsted, tow, paper, etc. For example, by his observations upon small bales of ostton enclosed in jute wrappers with iron hands, as this material is ordinarily packed for shipment, and of which one of our figures shows three in a pile, he explains in the following fashion the mechanism of so-called spontaneous com-bustion which at times bursts out in warehouses or on board ships

In the course of handling one of the hoops which encircles the bales of raw cotton breaks or comes losses under the action of sheek or some other cause, and a small fragment of the metal projects in such way set to form a ministrue Estrainar resonator. Then under the

General arrangement of the igniting resonator as set up for experiment

influence of the wireless way a sent out from some station, sparks pass and mine listely inflame the cover-ing of the cotton in their imm dust vicinity Equally, the contact between the metalli bai ds of the bales piled one on another in a car or packed in the hull of a boat, may establish an electric circuit offering the conditions of capacity and self-induction necessary for the producor supercive and semi-induction in cessary for the produc-tion of the phenomena of res mane. In consequence, when the circuit finds itself into trupted by imperfect con-tact between two bales incendiary sparks, apt to inflame the cotton, are likely to be produced.

The igniting resonator by means of which the wireless waves have been convicted of incendiarism

### The Locon otive of the Se

THE ideal condition in any transportation business is when all carriers are loaded and is mortise. This condition can soldom if ever be fully realized, but in accordance with the degree to which it is approximated accordance with the degree to which it is approximated deviateds will go up and cost to the consumer will go down. The steam railroad is able to carry goods occapily over long hauls for the reason that single care can be cut out of a long train and left on sidings to have a portion of their loads removed. If an entire freight train had to lay up at every station for which it cars that to lay up at every station for which it cars goods, a transcendings of left had would be a lifelong undertaking

goods, a transcontinental freight haul would be a life-long undertaken motor baulogs has found inscall con-The dealer in motor baulogs has found inscall con-tractions and the second of the second money to have an expensive truck and its expensive drives laid out for an hour or two while loading or unloading or both are accompladed. The answer to this has been the trailer, and the development of procedures under which the truck is sidelom or never loaded, but simply baulo trains of trailers, these it leaves to be loaded or unloaded. The second of the second of the second of the second trains of trailers, these it leaves to be loaded or unloaded. This can be carried out more of loaded, but simply baulo trains of trailers, these it leaves to be loaded or unloaded. This can be carried out more of loaded for unloaded in the second of the second of the second of the motor transport is practicable at all. But there is one field of transportation where the use of the train sprinciple is limited—and that is on the water. On canals, make harbors, anywhere where smooth water can be guaran-teed for the duration of a trip, a little tug can shunt a second of the second of the second of the second of the loaded. But in rough water towing becomes out of the loaded. But in rough water towing becomes out of the loaded. But in rough water towing becomes out of the loaded. But in rough water towing becomes out of the loaded but in rough water towing becomes out of the conditions which would bankrupt a railroad in a week, every ship that carries coam freight has to be followed.

every sinp that certies ocean irreignt has to be ide, during a round trip, for precisely the time which it takes to load and unload her completely The problem of reducing what our French con-temporary Le Genie Civil cells the period of immobility comes down, in last analysis to the separation of the propulate unit from the carrying unit Immobility on land is reduced to the minimum when the locomotive is an are reduced to the immutant wast the spoomoure is divorced from the froight oar and made a separate unit, or when the engine is divorced from the truck body and the trailer since goes loaded. If the motor element is inseparably tied to the eargo-carrying element, it is obvious that when this latter is not in motion the former obvious that when this latter is not in motion the former obvious that when the latter is not in motion the formes cannot be if would therefore seem that the problem of reduning immobility at see came right down to that of making the tow more universally usable, or that of making the tow more universally usable, or that of making loading and discharging more nearly instantaneous. As a matter of fanct, there is a maddle ground, which is perhaps best illustrated by the Shall system developed in England. We give on our opening page daggrans of this system.

It is pointed out that the course taken by the efforts to maintain a merchant fleet in the face of submarme depredations has been such as to focus attention very depredations has been such as to focus attention very strongly upon the conception of hull and machinery as separate entities, rather than as the single indivantle whole which they have always harvefore constituted Dalays in building ships have arisen almost endiring from trutble in getting the engines made and delivered It has therefore been quite natural torget imbued with the date that the senine does not necessarily have anything to do with the buil, and it is along this idea that the

she bull, and it is along this idea that the Boell system proceeds
The propulsion of the ships bullt under this system is electric. In general the motor and the generator are separate in-stallations. The latter consists of a Diesal sagins or a steam turbias, coupled with an alternator. The propulsary group in-ductes the helical propeller with shaft and reduction general diversity electron solder. The screws and electric motors ordinarily constitute nant of the agreement of the

reduction gears, driven by electric motor. The screws and electric motors ordinarily constitute part of the sarge-carrying bull; during a voyage thuy are someously up with the geocetting unit. This generating group is removable from gone ship to account of the same content, it is taken out of one buff and put in place in another by second of the place of the motor of the content of the same of the content of

# Southern California's Burning Canyon

## Shale-Bearing Rocks Whose Slow Spontaneous Combustion is Manifest in Clouds of Smoke and Steam

"HE spectacle of rain, fire and flood all occurring at the same time, is not an unusual sight in some of the canyons near unusual sight in some of the canyons near Los Angeles The most notable sample is near Santa Monica which is on the southern oses of California The pre-apticus sides of the canyons debouching into the Pacific Ossan in that vicinity are somposed of thay and shale Whenever rule falls on these rocks, great clouds of steam rise from the canyons. The canyon orwest and faces are cowned by vitrided rook burned a dull red

this reported by the early historians that when the Mission fathers visited this region 150 years ago the natives avoided these places. They claimed that these mysteri ous canyons were the abode of evil spirits and the Indians could not be induced to guide the priests to their vicinity

guide the presst to their vicinity.

The three photographs accompanying this article were made during a recent rainsform and show the bay of Santa Monics and its relation to the canyons, and the canyons themselves with the rising

and the carryon monature and gas During the infrequent earthquakes in this region the upper surfaces of the canyon sakes give off authurous gases similar to those noticed during rainstorms

notioned during reinstorms. Actual flame has also been reported in one of those canyons, and similar phenomens are said to occur at exertain places in Stants Bartars County, honce the occasional newspaper accounts of active 'volcanors mass the coast of California libe phanomens are widently due to fires in the petroleum-bearing shaler which crop out in these regions. In cause of the first is uncertain, they may be started by lightning or they may be a case of spontaneous combustion. Mesers may be a first of the first shall be supported in the second of the said of

M. S. Arnoid and it is someon, who investigated and subject some years ago, say "This unique variety of metamorphism has been at work locally in many regions of bituminous rocks in work locally in many regions of bituminous rocks in California, where a process of combustion of the hydro-carbon contents has altered the naturally white, soft shale to a rock of brilliant rose or brick-red color and rendered it in cases hard and vesicular like scorincocous rendered it in cases hard and vestouisr like acoraceous lava. The resemblance of the products to those of volcances and the existence of centers like solfataras where the process of turning has been going on during the last half-century has given rue to the statement that there were living volcanic vents in this part of Cali formis."

fornia."

In drilling oil wells burnt shale has been found at depths of from 90 to 1,000 feet, proving that the burning has taken place deep down within the oil-bearing formation, as well as at the surface

## Tumbleweed Becomes a Crop

ON the farm, as in other places, the best way to deal with an enemy is often to make him a friend Sweet clover, now a recognised, valuable forage crop, was

for many years among the most detected farm weeds of the Middle West The Rusthirtle, a tenacious weed of the Intermountain West, has made its debut as a farm srop under dramatic circumstop under dramatic droum-stances. Stockruisers in dreight-stricken regions out it and ensied it extensively past season in some pp it was the veritable sal-ipp, of a discouraged far-g, whase planted crops of fadled bim. The Russma, pite slong its minestes another has an engines surjan small needle-lifes spikes, it they in the side life in its testice. The size occase, a dast-class field for Rep-

Stratification of the rock in the burning canyon

vegetation The Intermountain West does not call the plant by its original name. Its home-made term, the

tumbleweed as far more expressive. The dead plant breaks off readily at the ground in the fall. Then the wind screes it. The tumbleweeds stru ture is so tough yet resilient, that a plant will whirl for miles before the wind only stopping when hung hefore the wind only stopping when hung up by a fence, a ditch or some other ob-struction. So out of proportion to its size is the weight of the big plant that it will highly fly high in air during a

hard gale
Children in the Dakotas Montana,
Wyoming Colorado Idaho and Utah, find tumbleweed a splended late fall playfellow I we big weeds are harmssed to a string, and in front of a wind they go hurting down the street driven by shrisking, hisply boys and girls. At other times the word becomes a kite, attached to a long cord dangling from a fish pole

Another western plant formerly re-garded as undesirable is yucca or soap-weed which in the silo is found to make edible and good livestock feed. The plant

equity and good hydrocause Maxicans and Negroes make a soap from its juice. It is also called the Spanish bayonet, and the dagger plant from its

## Electric Lighting Forty Years Ago

A CORRESPONDEN I brungs to our attention the Collowing introsting passage which he has translated from 1 all llustration Papenoals y Americana of Madrid issue of Ianuary 22d 1880.

Has Thomas Alva Eduon solved the famous problem of economics and practical lighting by electracity Scientific, tricles and great gas companies of the new and old world have occupied thomselves with naught the for the eart with the contractive of the lse for the past weeks

to date none can answer this question in a correct BUBE of the world A newspap r of New York the matters expresses itself in the fellowing manner Mr Ldison's lamp triumphantly withstands the tests of time it is unquestionable that he has given solution to a difficult problem, that of creating what we have with difficult problem, that of creating what we have with such anxiety waited for in short a new practical lighting system economical and usable by the majority However we consider it our duty to acquaint our

readers with what is positively known to date regarding the latest discovery of F dison demonstrated for the first

time in Menio Park on the night of December 30th By many experiments the calchrated physicist has suc-ceeded in placing small pieces of Bristol cartulin recut in the shape of a horseshoe into an uncandescent material less fusible than platinum and which obtains a degree of hardness equal to that of granite by the passage of the electric current

The editor of the SCIENTIFIC AMERICAN claims to have read a newspaper by the light of an Edison lamp hung at a distance of thirty-five meters

These electric lamps may be attached on the wall in the

manner of gas brackets

It seems uscless to tire the attention of our readers with a description of the generators and machines which tain electric illumination in all the houses of Menio Park for a space of ten consecutive mehts with satisfactory re sults to judge by the socounts published in the news papers Some of these as-sure that lighting by the electric lamp will bring a cheaper result than that sub-Some of these ascheaper result than that sub-mitted by the most inferior oil, but as we have not yet sufficient data, we limit our-selves to express our wish that all doubts will be done away with and that Alva Edison's new invention will Edison's new invention will be a worthy crown for his already immense reputation in the scientific world.

# The Seaplane Carrier "Argus"

## A Ship With a Five-Hundred-Foot Starting and Landing Platform for Seaplanes

 $A^{\rm I}$  the opening of the war in Europe a first-class cargo and passeager ship which was 5.6 feet forn, 98 feet beam and 40 etc deep was being built for an Italian shipping company. Becauseful for rush of war orders work on this vessel was discontinued but in 1016 the British admiralty deuded to take over the ship and transfer rint on large snaplant is zero; and thus work was done at the Wm Beaudmore & Co s yard on the Clyde where the ship had been

and down

The admiralty had aiready done some work along these lines in
the case of the 32-knot bettle cruiser Funous which ship has
already been illustrated in the Sciphyller American. In the case
of the Furous a flying dock extending from stem to stem was built above the original structure of the slip and because of hei length a long stretch of free and unobstructed plutform was available Due to the obstructions presented by the large smokestack the length a long stretch of free and inconstruct a platform was available. Due to the obstructions presented by the large smokestack the bridge, and the tripod inast it was not possible of course to utilise the whole seven to eight hundred feet length of the vessel as a continuous thinking. tinuous platform

tinuous platform in reconstructing the 'Argus however it was determined to provide an absolutely closer runway for the white 535 fost length of the vassel and also to build within her a large hangar capable of housing 20 sexplaines and the various workshops storroroms etc. what are disturbances are produced by the upper attructures of a ship when driving at spord showed that to get the bost results the space between the hangar roof and the flying deck must be left as open as possible. Consequently the flying dick was carried upon an open frame-work consisting of steel columns braced diagonally as shown in the accommopanying illustrations.

It was also found that the amission of gaoes through the usual fit was also found that the amission of gaoes through the usual

It was also found that the emission of pases through the usual vorticed finnels of a steamship produce service are disturbances, and consequently it was decided to connect the up-takes from the bodies placed below the flying deek, which would lead the gases to the stern of the ship and there discharge them. These horizontal funnels are provided with expansion joints, and they are kept cool by means of vanishing fans. At the after-ends of the funnels are large discharge class such about 10 feet in dismetter which are driven by 74 brike horse-power electrical motors

The flying deck is tirely clear of obstructions. There are no functed masts or pit is huse visable when the flying platform is in service. The small pils shows shown in one of our illustrations can be raised position, but via no gain into action it is brought down undit as roof is flush with it ellipsic clear. There are two destricts forward for lifting the plant from the water, should they alight there, and off the flush of the flush of the state of the same purposes. Of the clear flush of the state of the same purpose of the state of the same purpose. Of the state of the same purpose.

Below the flying del there has been built a seaplane hangar which is 30 feet long by 68 f 4 wife with a clear interior width of 48 feet designed to accomm 1 tr 20 seaplanes

designed to accomm it all sequences. This hanger is built if we the original shelter deck of the ship, the roof above being unted on deep web frames. These frames are carried up the ship s at to a height of 25 feet 6 inches above the original sheltered it. I he roof is built of steel on widely spaced in transverse garders as 11 agricultural beams and there is a clear headroom in the hangar f d'out 20 fest. In the hangar is a thermo-tank heating unit un i on the walls are radiators, racks for carrying torpedoes, and also at everhead runway for transporting the

In the storerooms are nonmodated spars parts, wings, propellers, torpedoes and bom's and forward of the hangar are large writershops fully equipped with machine tools. One of our illustrations shows part of the writering the statement of the property of the writering and provided within the mental protective netting surplane engages and privilers which has the usual protective netting around it

The navigating bridge houses for officers, etc , are placed forward The newqueting bridge houses for officers, etc., are placed forward under the frijing dock and only the chart-chouse ever appears above this dock. The chart house so capable of being raised above the dock by hydraulic part. When in the raused position, it commonly dock by hydraulic part. When in the raused position, it commonly a clear allround vice. The chart-house travels in vertical guides, and its in raised and low are day a hydraulic raim.

There are two the tracilly controlled elevators for lifting the altring the hanger to the flying dock, and when those has not in

deck and two of the 4-inch runs

persing the Sying deck

The "Argus" under way. Note the clear Hyling deck and the smoke discharged aft. The uptakes from the boilers lead to two horizontal financis extending ait, one on each side of the ship, which discharge the gases astern, where they do not provoke ar distributes or contains the first many.

use, the hatchways are closed by sliding pistforms. The after lift is 60 feet long by 18 feet wide and the forward lift is 70 feet long by 86 feet wide. Each of these can lift the largest between planes with the wings folded heat: As soon as the pigases reach the flying desk, the wings are swung forward and coupled up and the machine is ready for flight. To facilitate the landing of the atriplanes on the after part of the flying deck at night time, special illuminating arrangements are provided for the guiding of pilots. In addition to lamps at each side and across the flying deck to guide planes when handing at might for guidance of the planes in minesurerang during davlight. To retard the arreaft when they land, a special guirang davlight To retard the arreaft when they land, a special grangement of the mattresses is provided.

matriesses is provided in addition to the storage for aircraft in the hangar, provision is made for carrying them on the flying deek, in which case a timber palisading can be raised about this deek to ack as a wind sereen like palisades are so arranged that they can be suced simultaneously 14 feet above the dock level. Outside of and aircumd the flying deek is fitted a wide safety net

is more a wide sately net.

Two signal and wireless talegraphy masts are arranged as shown above, so that they can be lowered flush with the flying deck. There are special contrivances and winches for overthasiling all slack rigging, this also applies to rangefinder and gun control instruments for use with anti-aircraft guns

with anti-arcrait gues.

The ships are with four 4-msh satis-freedit gues which can
The ships are a submarines and two 4-sheek quickfire gues.
They are so placed as to afford all-around said overhead protection.
Our thanks are due to Messer Wm Beardgares & Co., the builders
of the "Argus, for our photographs and to London Engineering
for the descriptive matter of the very interesting ship

## Valuable By-Products from Gold Dredging By Arthur L. Dukl

THE mining of gold by the dredgar process has been practiced throughout the world for many years, and in this country the dredging senters of Californa have enabled that state to remain the front rank of gold producers in spite of the virtual suspension of hydraulie mining and the decline of many of the larger lovel cames Many millions of dollars' worth of gold are annually taken from the sarrb by the California gold shape, and bundereds of sorre of gold are plowed to a depth of from 15 to 45 feet in the quest for the gold. Under ordinary circumstances, when land has been throughly dredged it is abandoned, and the up-turned sed is left in the form of

long hills of cobblestones just as they are delivered from the dredge stacker Whatever silt and fine material is excavated usually seeks the lower levels through the interstrics of the stones and is thus lost Practically no vegetation grows naturally upon the failings piles, and until recent years no effort was made to utilise the great mountains of rounded stones raised by the lee lace

The lands dredged were usually rocky river washes barren of vegetable growth incapable of raising rops and in many cases were subject to overflow and thus rendered unsuitable for permanent use subject to overriow and thus rendered unsuitable for permanent use Occasionally, however an orthand that or cultivated held would be embraced within the dreiging are a suid the value of the land for mining being greatly in excess of its value for significantly or horti-cultural purposes the lands passed to the dreiging companies and were mined

Fortunately for the state the proness of a lang men were made up of the type that blave of an devel praje (very resource of their community. They had other interests in the vientity—orthorder, anchoes electric radicody—of the yield radicological to the state of the state of the properties of the properties of the state of the good from let a the surface. So while the number of the gold foreiges was multiplying in the set in for newer dredge organized a company to conditively men its in utilizing the millions of toos of colobelectors truncl up by the latter of the state o Fortunately for the State the pioneer dr Iging men were made than a hundred thousand dollars was spent it an eff rt to crush th tailings. Owing to the extreme hardness in dithermin led smooth character of the cobblestones however it. I first attent to produce a commercial product were failures as the ordinary rock-crushing machinery was inadequate to meet the strain. However the operators persevered and sunk another hundred the usend bilars in new machinery designed especially by their engineers. With a plant With a plant built almost entirely of minganess steel the cobblesiones were

With practically unlimited quantities of crude material available near their plant, the dredge men thought the returns from their new industry would equal that of gold dredging but they soon found that it was necessary for them to create a market for their product. Their competitors who sold natural crushed rock of a softer nature near competitors who soid natural crising rock of a softer nature spread reports of the extrue. hardness of the new product that pre-vented it from knitting properly when used with commit and a great dead of pioneer work was necessary to get the new material intro-duced into nearby markets. But the men back of it were fighters,

## Recent Explosion of Kaint Volcano, Java

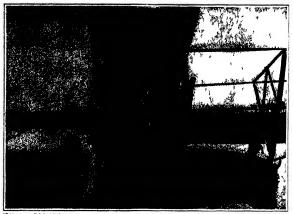

Recent Explosion of Kalet Volcano, fava CN, May 20th, 1918, the volcano of Kalet in greatern Java burst into violent serupiton sensing great destroction and extensive loss of life in the District of Brungas and in the vicinity of Biles. S' S loss 112° E) Unreplectograph absets Kalet volcano at one of its more active genglas, these Kalet volcano at one of its more active genglas, when it was graving off moderned closed of pleasa, and alovity adding to the very low their employed member of the musicy tritings solving has built. The control of 
weathering thesth and destructions are interested in the conlines are into wide, and proleting lists our upper atmappings a cloud of dust that prainisted for zereal years and produced the most high this deviced men had greated and the colors of the ingent that schools are deviced by skinlinely colored tought to yellow the colors of the colors of the produced with the colors of the produced with the colors of the same of our daily papers have reconsily cautioned us to be to the lockout for such phenotheneas again. However there is no information yet at head to indicate that this reseat explosion of Kallut attained the violence requisite to produce such

Volcanoes are predomin antly developed along great breaks or faultings in the sarth's crust, and in or near the present sea coasts. It was long believed that these two facts were of great significance oncerning the origin of volcanoes but many have also been found in the contract of the contract of the contract of the contract and fractures can have been of any determining value and the series row has been

modified it has finally been concluded that the heat betrayed by volcane activity is probably a remnant of the original heat of the earth when us a much more highly heated state and that the molten rock or magma is largely a remnant of the original molten globs. The water whole escepe as steam in nearly all eruptions—for it has been recently proved that it is water—as probably in large part an original constituent of the molten rock, and is associated with a number of other posses which also enter into the composition of the rocks. The probably is the entry than the composition of the rocks. The probably is the entry that the composition of the rocks. The probably is the probably in the next consistency within the control of the control of the rock. The probably is the probably in the control of the expensit of the earth. In the case of the least volcant are of the segments of the earth in the case of the least volcant and commently significant explosions seem to be the sudden raised of stresses which have been allowly assumulating for centuries until the entited point of the superplacent crust has been acceeded.

## The Transatiantic Scapiane of the Future

THE Navy has announced that the flight across the Atlantio was undertaken as we showed instead with a fine of the state of the world be capable of flying to the European submarine some under their own power Although the close of the war ended the need for flying the hoats over for purposes of war, the Navy decided to go absed with its pregram for the purpose of obtaining the valuable data which would be sequend in a transatiance flight.

Wreckage of the lower left wing of NC-3, due to pounding of the seas in heavy weather Note that

We publish two photographs of NC 3 taken upon her arrival at the Asorrs which are of extraordinary interest bosonses of the lessons which they teach for as we noted last week, Admiral Taylor in proposing the associated that the second property of the s

Therefore, a fyring boat if it is to deserve the name must be sowersthy, not merely in ealin weather but when the wand is string and the seas are high. These too photographs show that in the present state of the art we have yet to build a plane of the type which Admiral Taylor called for in his original memorandum. Two out of the three NC boats were forced to descend in trong winds upon a rough see. One of these anix while being towed to port, and the other was completely wrecked in what is obviously its most vulnerable part namely, the lower wings. Here pictures testify at almost to the strength and the fraintly of the wings triudium choice to the strength and the fraintly of the wing triudium control to the strength of the through the orderal intact. The lower wing-beamshare in places and apparently in line, what collapsed were the transverse miss and the

curvas covering. The beat and the outrigger frame for earrying the tail seem to be in good shape and the tail itself except for a slight tear in the canvas seems also to have come through in pretty good condition.

first and obvious les sor is that it will never do to place the present type of canvas covered wing so near to the surfice of the water One way out of the difficulty would be to abandon the lower plane altogether ex-cept perhaps for the middle third of its length in the way of the engines and build the future flying boat as an outand-out monoplane with the carrying surface 15 to 20 feet above the sea. If the of the monoplane wings would be too large and the raising of weights would render the flying boat too unstable the only other plan would be to provide lunger at the panel points adjoining the engines and have them so arranged that the hinge could be quickly unlocked a soon as the boat reached the soon as the boat reached the water and the wings swung back into the longitudinal position and made fast to the boat structure This of course would involve build-

ing a continuous boat up to the tail structure in order to provide a point to which the swung back wings could made fast. A boat of this type with greater beam for stability could be handled in a rough sea.

As to the question of what type of anylane would have the but chance of crossing the Atlantic is a non-stop fight it is divided between the small ample-engine high speed plane and the large multiple-engine plane of lower speed. The former has the advantage that the number of hours in the air is considerably less, and there is a greatr possibility of getting a rose on a favorable day before a sudden change for the worse of weather conditions occurs. On the other hand, the breakdown of the engine means the loss of the whole trip

test now Britsh onnon favors the construction for a straphtaws flight like this of large biplanes, carrying a plurality of engues five aix or seven as the case may be with the enguine arranged in banks within the ancelle and with chain or shaft transmission to the propellors With a plane of this type. two or more engues might be out of service without rendering a descent necessary. The placing of all the engues in the nacelle and under cover would make it possible to effect repairs change spirk plugs etc while the machine was in

In dosing we wish again to bear tribute to the pluck and skill with which Commander Towers navigated his wreckel erift in rough water for over two days over a distance of some 200 miles. Everyone should see the moving pictures showing NC-3 driving into Ponta Delgads harbor before a stiff wind and wa

le in parties the main structural framing aboving seaves stripped from the lower wings. The main structural framing stood the severe test

## A New Bank Desk By Coxymine Wilson

A BANK desk of great convenience to the banking and commercial world has recently been invented by A E I alls a bank employee of Chicago The Palis desk proves its efficiency in that it reduces floor space ordinarily used by one half and increases the efficiency of employees from 10 to 15

A little adjustment of the top which may be raised or lowered at will as any ordinary lid and practs the desk becomes a standing desk for assorting checks, etc with hid down or a bookeeper's desk for computing machine and ledger, with hid

When the top is folded back the book When the top is forced back the book keeper aits on his shool oblivious to his best pals or the pretty girls at the next dasks because he is shut off from overy

uses because no solution from overy thing but the business in hand. On the left side of the lookkeeper are two drawers the top of which may be used for a shelf on which to place the work for recording. On the right side is another shelf somewhat lower than that on the left which is used for lodger rack and ledger. The center space accommodates the computing machine on

its own stand
Dosks range in price from \$90 to \$125 according to requirements. They are made to order to fit any bookkerping or computing machine used in commercial or banking work and to carry any I see leaf ledger rack, or tray or the larger sheets of the Boston system A popular sales as two feet two inches long five feet sax inches wide and 41 or 43 inches high. An adjustable light with improved knuckle joints which enable the light to be knucke foints which enable the light to be used freely in any position accompanies the desk. Many I anks of Chicago and other large cities have installed the Falls bank desk in the last year and found it

## The Motorcycle Turned Taxicab

IT has remained for the English to develop the conventional motorcycle with indecer into a public taxicab. By building a somewhat heavier and longer than usual the English have arranged it for carrying two passengers while the motorcycli carries the driver all as shown in the accompanying illus-

A deak that can be adjusted for standing and sitting jobs

tration. The sil car is provided with a top and side curtains making it available in all kinds of wather. The springs are said to be projerly d signed and distributed so as to take care of roal.

irregularities All cycle taxicab covers any dis-tance in better tance in better automobile and the fare is on siderably cheap r

# A New Idea in Hand Punches

No other punch ated all day with the mechanic as the one shown in the accompanying illustration ac

earding to its in ventor. And he proceeds to explain this ease of operation by pointing to the absence of long clumy handles the fact that the operator is brought close

to the material the punch marks are foll w d quickly and accurately, the pi l is extremely light in weight the at suick and positive only half a turn of the lever

being required to drive the punch through metal the handle above the center keeps the punch naturally upright the punches and dies are more easily changed the punch may be easily clamped in a vise if desired and there are no pipes to fit or adjustments to make

The new punch is intended for the tool kit or shop It is powerful compact port-

in the illustration may be deep throat and one-piece disappearing strappes, giving a to punch and punch mark is operation. The design pegs operation. The design penulta as shocts to be punched with one-operation. Also, the design is such as practical altimate punch breakage, and peak will not leave a bur on the metal cording to the inventor's claims.

## Collansible Tube Holder

Collagable Tube Heisler
TYEE use of collagable tube containers
I for tooth pastes, cold creams and telest
articles is too well established to require
extensive explanation. And it as also well
known that such tubes, convenient as they
are are open to the one objection of becoming unagably when these consistests are
pretty well reduced and the tube is more
cless of a shapeless mass. To overcome
else of a shapeless mass. To overcome
Beoddyn N Y, has invented a simple
Beoddyn N Y, has invented a simple
uvelanged holder which acrows against a
wall and which serves to hold a collagable
tube in an unprahip topation with the spout wan and which serves to note a conspanse tube in an upright position with the spout below. Thus, to dispense the contents the user merely has to press the collapsible tube held in the holder starting at the upper end and going further down as the contents become less and less

## Shower Bath for Mules

ONE of the large mining companies has installed shower baths for its mules that work in the mines. The ideas of humans treatment for the laborer that are being used by all the large companies have here extended to the animals, and the tired mules or horses the animals, and the tired mules or howese that have worked all day in the tunnels of a mine are refreshed by a best that leaves than relaxed and ready to read. It has been found that the animals that are taken care of, given a good place to sleep and otherwise treated kindly last such lenger on the job and do better work. The framework of the shower batk ag-paratus at lies a still into which the mule paratus is like a stall into which the studies in driven From a water pipe not up of the structure three sprays are placed at equal distances so that when the water is turned on the animal a back us coverned with spray. All the dust from the coal is washed away leaving the beast fresh. At first the multies were animaly as period and fearful of this constrivance but in a very short times they needed no pre-massion to enter the stall for a shower

Motorcycle with special sideous used in England for taxious services

# Dependable

Unfailing dependability is a characteristic inherent in every SERVICE Motor Truck.

Wm Greensbery, in charge of transportation for one of the large depart ment stores of the middle west, speaking from a broad experience says

"Our Serotes Trucks are giving wonderful results For the post six months we have covered delly suburban runs of 125 to 150 miles The trucks have not been laid up for repairs a single day and have never had to be toxed, the running three snows and the soft roads of apring

SERVICE Motor Trucks are so scientifically designed and all parts of the assembly are so carefully co-ordinated that dependable performance is assured

# Many a Man Thinks His Full Duty Done When He Takes Out Fire Insurance

He thinks he cannot lose. If the worst comes, he is safe.

He is vitally wrong.

A fire insurance policy is only a provision for regaining the value of property destroyed by fire. It is not protection against fire.

The whole loss caused by a fire cannot be repaid. "Fully insured" restores only the physical loss. The attendant losses—perhaps more serious—are not made good.

He should insure against fire—so far as humanly possible—to prevent a fire occurring. That is the only way to be secure.

When he buys a Hartford policy, he pays for fire protection, but he gets full protection only when he performs his part. He ought to observe every precaution—and the Hartford agrees to tell him what precautions to observe. But he must see that these precautions are en-

forced if he would do all he can to save himself from fire. 637

Whether you are a policy holder or not the Hartford is helping to protect you against fire.

Its inspectors and engineers are inspecting buildings in your neighborhood, suggesting methods for reducing fire hazards and installing and supervising apparatus for extinguishing fire as well as introducing safer systems of manufacture and operation.

This constant work of systematic fire prevention is operating to save your property though you may be setting all these conserving efforts at naught by unthinking carelessness of omission or commission.

The Hartford serves first by helping you to prevent fires; second by making good the value of property actually destroyed by fire.

Are you making the most of the double service of the Hartford?

Any agent or broker can get you a policy in the

## RESTREES

# Conveying-1919 B. C. and 1919 A. D.

The patient burden bearers of ancient times little dreamed of the modern belt conveyor that would one day lift the burdens from the shoulders of mankind

To-day there is scarcely an article which you use that has not made some part of its journey to you over a rubber belt conveyor. The coal in your cellar, the sugar in your larder, the grain in your bread, the gravel on your walks, the cement and other materials in your house—these and countless other items have at some stage been handled on belt conveyors

UNITED STATLS RUBBER conveyor belts not only relieve the burdens of human beings, but they reduce the cost of handling maternals to the minimum. The heaviest maternals are moved it less than one-half cent per ton cost of handling

We have now developed the manufacture of rubber conveyor belts to such a fine point that each class of materials conveyed has its appropriate cover of the proper thickness and consistency to withstand the service it has to perform.

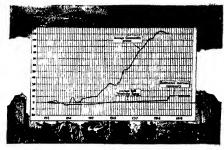

Wherever materials must be transferred short distances at the minimum of expense and the maximum of speed, belt conveyors will quickly prove their economy and efficiency.

Wherever belt conveyors are used, the UNITED STATES RUBBER COMPANY'S conveyor belts will prove most satisfactory and economical

**United States Rubber Company** 

**U.S.Rubber Conveyor Belts Are Good Belts** 

# A Comparison of Costs

A graphic picture of the high cost of doing business is shown by the rise in a long list of commodity prices during the past five strenuous years.

By the exercise of unparalleled economies, telephone rates have been kept almost unchanged.

The fact is, the increase in the cost of commodities has resulted in what is equal to a decrease in telephone rates. In other words: The dollar which was spent for the telephone has bought more than twice as much as the dollar spent for the commodity.

The activities of reconstruction which are now upon the nation have put a great burden upon the telephone. This condition has made necessary an advance in telephone rates.

This advance does not excoed an average of eight percent; almost negligible as compared with the advances in other lines of industry, yet enough to cover the increase in the cost of operation.

Only through adequate revenue can there be assured the maintenance of a high standard of telephone service.

# Invention as the Foundation of the Nation's Wealth

(Continued from page \$25) Depotle, first trolley car, Lay, dirigible torpedo boat, Brush, are light, and Howe,

sewing machine
( harts showed the growth of the patent work in the United States It is very interesting to fine that not used now we pass 10,000 patents per year (now we resus almost 50,000 yearly). The automatic telephone exhibit and the coal-tar saces were shown as examples of industries which exist literally on a foundation of patents—the one with 1,068 different jutents, the other with 2,492.

As an education in patentia the exhibition was an emphatic success. Many curiosities were exhibited, such as a patent signed by I homas Jafferson, also the only patent saved from the patent office fire of 1836 to one I Studies for of 1836 to one J Snyder, for a stove, and many quaint colored drawings of early

There has been from time to time a There has been from time to time a movement to establish at the Nation's (apitt) a permanent establish which shall, be both of the work of such state, maken be not been such as the property of the such shall be the property of the such shall be such as the property of the such shall be such as the property a validor might spend a year in the Capital and never have any one one property of the work, for instance of the Interno Department, just as not once in a thousand who come to the Capital have any idea of the extens, value could be such as the property of the such shall be such that the property of the such shall be presented by the such shall b before the public could be continued to the great benefit of those who form and maintain the government. As far as the part in office exhibit is concerned it could only be regarded as a keen stimulant to innegnation to invention, and to ambition to invent and patent. Inamuch as prac-tically all our national wealth which is not founded upon natural resources comes from industry reared on patents as foundamined and reaped largely by instrumentalia stimulation, governmentally maintained, would certainly be much in line with the government a idea of using its facilities for popular education Incidentally it would help both patent office and inventors to a better understanding and therefore eloser COOPERATION

## The Locomotive of the Seas

(Continued from page 828) morite as gondy let down into place on the hull for an electromobile of 4,500 horse power, sufficient for a hull of 10,600 traw diadweight the lifting force called for is less than 350 tons, and the length of time required to release the hull from the generating unit is 10 minutes. The dock generating unit is 10 minutes are dependently a single man, and presents no technical difficulty of any

The inventors of the Suell system are princularly interested in the problem of ceal transport Before the war there were annually shipped from the Tyne to Lou lon some 900,000 tons of coal With the buell installation it would be sufficient the brief matiliation it would be sufficient for the traffic to have 24 bulls of 1,200 tone dondweight each, and 8 dectromobiles, with two small footing docks, one on the Type, and the other at Grayesand. The outmated benefits would be very large. The single circumstance of influencing the electromobile at Grayesand had lowing

sued from page 640) poured over the stones so that the mud and fine particles of soil may find lodg-ment on top and be saved

While it is not expected that even a large proportion of the dredging lands of Cali forms can be reclaimed by the processes been described yet the success so far met with and the efforts being made by the with and the efforts being made by the dredge men themselves anounts us to being we that as uses can be found for the lands thus mixed, the means for rendering them is anishe for use will be forthcoming. Uniquestimably the larger proportion of the interest of the second of the second of the second of the use of the useful purpose. At the same turne, the development of the process of dredging whereby the land can be plowed up and the gold recovered, without scroundy interfering with its pranasses whose for greating or coop promps fitled be discovered in the future, they can be developed even though the surface can be developed even though the surface can be developed even though the surface. can be developed even though the surface of the lands is valuable for other purposes As suitable dredging lands are worth from \$1 000 to \$20 000 an acre even the very finest farm and orchard lands could hnest farm and orenard lands could be bought at famey prices and dredged after which the areas could be turned back to their former owners and used again for their original purposes. The practical ensummation of this plan would entirely beautiful the process. r move all hostile public sentiment against the deedging industry on the ground that it destroys the land This is a condition levoutly desired by every dredge op in this country

## The United States Patent Office By Edward Thomas

MAN's people will be surprised to hear the United States Patent Office ill dan advertising agent still it is not only that but an employment agency as will. The Patent Office does its advertisng largely by publishing the names of inventors and this publishing is done every a ck. I ach I ucaday noon the Patent Office mails to inventors or their attorneys and at the same time it mails several th usand copies of the Patent Office Official Cazette which contains an index to all the inventions patented and published that week besides the names of the anventors and a brief summary of some features of the inventions. Some of these putents together with the names of their inventors are soon buried in obscurity, but by no means all of them and probably only small friction of them for each week the Put at Office Cazette goes into the offices of hindreds and perhaps thousands of manufacturing firms and is there scanned regally for the inventive news of the hun heds of patent attorneys who are on the utlook for any bit of inventive information which may interest their clients in such information is passed along to th m unufacturer or promoter whom the patent ttorney thinks will be interested in it and with that information goes the name of the inventor whose ability is thus ad-vertised to the parties interested in his invention

invention

For example one inventor designed an admirable apring motor for a certain ma him. A maker of another kind of machine and the motor published in the Official Gasette, write to the inventor describing his needs, and asked the inventor what he could do in the local countries. that line The inventor not only solved the problem but today is getting a reyalty on the patent which solved the problem Meantime another of his inventions was another harse manufacturer in another line, and obtained for him a good noution as a professional inventor for that position as a professional inventor for the manufacturer. If it were not for the fac-that most inventers put a very examplerate estimate on the value of their inventions

and James

many more inventors would be agreeably suggested each week by inquires about shift inventions and by receiving offers of new jebs,
Unfortunately many inventors find it

Uncorrelated many investors and it difficult or impossible to work for either people because if they have not already in exaggerated idea of their own importance they soon acquire such an idea Many employers therefore hesitate to approach an inventor directly with view to hiring him but use indirect methe of approach But the manufacturer or promoter depends on the latent Office for promoter depends on the latent United for sorting out the really bright men from the erdinary run of people for getting hold of the really bright men who will give him of the really bright men who will give his something that will soom new and useful to produce or that will can be higs to broaden the scope of utility of his produces. In this way employees of factores, loosted remote from towns are brought in sonsh with other manufacturers especially with manufacturers who furnish the supplies the machinery and the tools which they see in their round of daily work. The men in remote factories who have valuable ideas are often foremen or workers at the machines and it is an order of the same are able to come in touch with the machine ery builders in distant etites.

ery builders in distant entres. Not only is the Patent Office an adjretfising agent or employment agency bits it also furnishes unrequiently recommended tions of the help on its advertising list. It does the because the Emmissers of the Patent Office pass upon every applimation for a patent and determine whether the ideas have sufficient novelty to entitle the applicant to a patent. Thus every preprint and applicant to a patent. Thus every preprint who gets a patent that to run a serfain mental gauntlet and the abdity to pass that gauntlet is no small recommendation of mental ability or at least of originality. that gaunties is no small recommensured.

of mental ability or at least of originality. The publishing of the patented application apreads this recommendation far and wide through the Official Gasette which, see stated above, is published each week Besides the names of the inventors, the pessives the name of the investory, tag Gassite contains a partial picture of sash invention and a rough abstract of the scope of the invention. Thus, the recom-mendations of the Patent Office are not more statements that the person who gets more statements that the person who gate a patient does assistantory work, since besides that implied compliment, the Petent Office picture is a speciame of the man swork, so that any one can judge of the character of the work. Further say one who wishes to know more about the details of a give nureation can buy a copy of the whole potent for five centa by sending to the Patent Office of the Patent Office

## Why we emphasize popular price in this roofing label

BECAUSE heretofore quality alone has been the standard by which Johns Manville Roofings could be judged in relation to ordinary roofings

Price or first cost has been the one factor on which cheaper roofings could rely and undoubtedly thousands of buyers have denied themselves the splendid durability of a Johns-Manville Asbestos Roofing because of its apparent expensiveness

For years Johns Manville has been working to produce an Asbestos roll roofing that would provide the weatherproof fire retardent qualities that Asbestos alone can give at a price that would meet the widest popular demand. The result is

A Johns-Manville roofing of Asbestos rock fibre waterproofed with natural asphalts Being all mineral, it cannot not or disintegrate and therefore does not need painting or coatly refinishing

### Stone Roofe Den t Burn

No other ready roofing can give you the fire protection of Johns Manville Asbeston. Asbestone is the only low priced roofing that will stand the famous blow-torch test." This fact alone has placed Asbestoe Roofing on thousands of even temporary structures where fire meant big risk to production programs. Furthermore it does not dry out because the natural asphalts bound between the tas marris asparsis bound selvers me asbestes felts (insuring a permanently waterproof and flexible roofing) are sealed and shielded from the sun a best by the very insulating properties of the sabesigs felts themselves. In Asbestone roofing, the felts protect the water That is why Asbestone never needs coating or costly refinishing Add to this, its qualities of weatherproof per manent durability—and it is easy to see why Asbestone is fast becoming the most popular roofing in America

## Register Your Roof With Us

As with all other Johns Manville roof ings our responsibly does not end with the sale. The registration blank in every roll invi es you to record your roof w th us and means that the Johns-Manville registration assures you service promised

Basing Automint, also made of Yellow Strand Rope, is tow-home insurance. Has parented Snaffle Hooks. At dealers, \$5 80 east of Rockies Primargrams, The Cheline, is needed by every track-ow or Results seet of Rechine at \$11.10 with plain head y \$12.75 with 8 aft o Hooks BRODERICK & BASCOM ROPE COMPANY ST LOUIS of Colorated Tellery Strand Wire Bone Used at Land POWERSTEEL Autowlock doubsers who think that United States under obse-pations are of dubleus value because in government about had the hirfurgestent suits the As resulti-pations are held no good or not infrigated, in England Asynon who thinks a moment will perceive, April, 1918, that there are very leve peiseat leasuits was introdu in which each mad does not believe that arons the it has a chance of wirming, for what it the rood going of the constraint of the constraint of the rood going of the constraint of the constraint by the root of the constraint of the constraint of pair-ths of undoubled validity are seldom harden of undoubled validity are seldom harden of undoubled validity are seldom, health, one suct on, and for a smaller reason patents in Tables and nations of undesibled validity are seldom sured on, and for a smiller reason patents which are known to be no good are seldom defended. The reason why there are more patent state in America than in any other country is partly due to the small financial risk in bringing a Unified States suit, compared with as English suit, for example. In England the losing party has to pay the lawyers feet for both seldom darks to suit a large corporation unless suit of winning. In the United States, however the man who sues another cannot loss more than he is willing to pay his loss more than he is willing to pay his lawyer, so the American poor man has a somewhat better chance

One illustration will suffice to show the risk of bringing a suit in England The financial advisor to the owners of a valuable British patria, after they had used a certain infringer and won, advised them to give the infringer a home at a price angusted by the latter—a very high price it would seem today. The owners refused to do this and decided to stop the infringer. The infringer however, appealed and persuaded the fourt of Appeals that the patent was yould be events of the nates that the void like owners of the patent had to pay over to the infringers some \$200,000 for the expense of defending the suit Thus the patentee was not only without Thus the patentee was not only without he patent but so much the power for have g tried to enforce the validate of it. That could not happen in the United States. It Curmany, practically the only other large industrial country which has examine pass on all patents essend by it, the patents mainly appear in the names of the patents mainly appear in the first and the patents of the patents are not been after the during my years, so these concentrates are a bar to many German. cumstances are a bar to many German lawsuits on patents Besides this, in most many conservoss infringements of each others patents and they settle for relative durings; for cross cross licenses without lawruits

United States Patent Office and patent laws need improving, and there are several movements on foot to amend our patent laws to attain both these ends to be hoped that in amending the laws, Congress will carefully keep in mind the necessity of preserving the advertising value of the United States Patent Office, and will be careful not to reduce the already too few advantages the American inventor has m getting his ideas before a world is anxious to profit by every bright ides that can be successfully utilised

# Rabies and the Public Health

ROM lengland on April 24th, there oame to the American press sensational ports of an outbreak of rables, so wideagrowd that a condition akin to said west created Dealers in dog musies were evented believe in dog musies were swamped, and were accused of producering Dogs were stoned in the streets, and owners put their special pets to death by panile sprocesses. All this brings to misel were vividly Engiand's remarkable record were vividly Engiand's remarkable record was recorded to the second way of the second suggests some important conclusions with reference to public health, as a world problem England's remarkable showing is due to strict dog laws and their spioresment From 1887 to 1889, thous was an example of the second supported suppo spread that a condition skin to panic was

under observation for six metatha government. All stray dogs were As a result these her been no once of in England sines (900 paid she circle April, 1919. It is rusmoyed that the was introduced by was introduced by sole across the Channel in

the quarantine Pully to comprehend the importance of quarantine, as a protection to public health, one seeds only to receil the cause of rabines and its means of treasmission. A minute proteosom or one-celled animal, discovered by Negri la 1904, and assensed after him the Negri bodies, as the direct cause of the discovered by Negri la 1904, and assensed after him the Negri bodies, as the direct cause of the discovered by Negri la 1904, and assensed time health of these Negri bodies is desceeded in the brain cord on a misrecoopue alies and stellaring its with a particular fluid, called the Gleenas stann. This stellar is taken by the Negri bodies and differentiates them clearly from the other brain time. Their presence in the brain or spinal cord dischindry determines the fact that the animal was a vettim of rabine one, at once, instead of the control of the new of the control of the vertime to begin for the results of the war has been that governments have taken up health activities on a scale never before attempted. The health of the combetor attempted. taken up health activities on a scale never before attempted The health of the community is no longer a question of the individual, but of the individual and has relation to his neighbor. The recent out-break of hydrophobia in England after break of hydrophobns in England after her long mmunity, should give pieuse to New York city with a dog population of 500,000 and less than 100,000 of thasis licensed In one year, 1914, moreover, there were ever \$,500 persone in New York city bitstan by dogs No after-war problem is more important than this one of public health and the rigid enforcement of quarantum, that proved se effective in protecting England against the dread disease of rables.

## Metal Strapping on Wooden Boxes

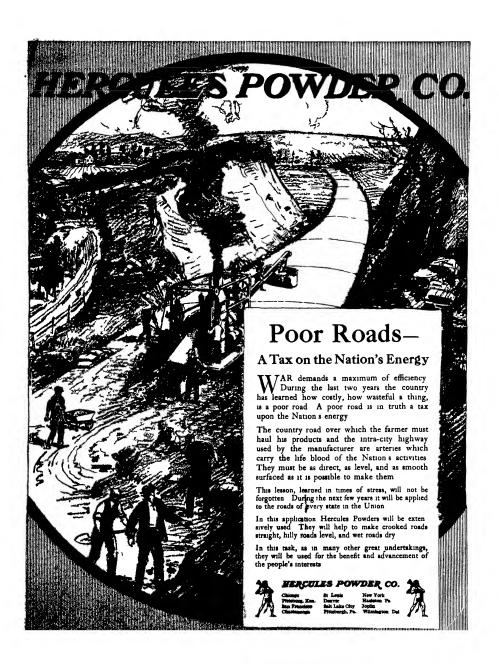

Metal Strapping on Wooden Boyces

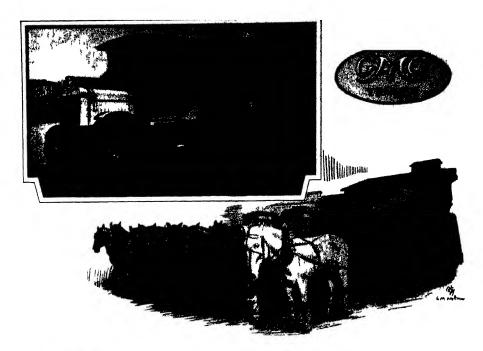

Onle of the quicket and chespects meshwooden box to vary it with thin, flat
metal straps. The shirty of a box to
withstand the hazards of transportation
may thus be increased several hundred
per cent lests made at the Forest
information as to how a box should be
strapped to add most to its durability.

The best bloses to annive the attention

The best place to apply the strap is apparently about a quaffer of the length of the box from the end. The strapping is preferably nalled at each edge of the box to the box to the box to the day of the box to the strapping drawn sung by special tools for that

crewn soug by special tools for that providing the strap in place works will on boxes made of fumber 1/4-inch or mote in thickness, but onnot be recovered by some or thinner material because the nat splits the board On this hours it is uncoassay to join the two ends of the strap (for which, purpose there are several devices), there is no the strap of the strap of the strap in the strap in the strap in the several purpose there are several devices, there is no the strap in the strap in the strap in the several properties of the sever

Depending on tendous slows to keep the strap in place is, however, open and one section of health of the strap in place is, however, open and one section of health of the strap is not set of the strap is no longer tight action not only reduces the effectiveness of the strap, but a shrinkage in moisture or the strap, but a shrinkage in moisture owners to fall off when the bowns we be considered to the strap with the strap we fall of when the bowns we have the strap with the strap with the strap was partled at each profession. The effect of shrinkage of the box is also refrom when the straps we gailed at each possible strap is thus dispulsion and the local strap is thus dispulsion and the local strap is thus dispulsion and the local strap is the strap and the strap in the strap in the strap is the strap in 

## For Example

Take rad ato construction as an example of GMC thoroughness. This vertical tube cont nous fin core is the most afficient known. It does not depend on solder fo assembly strength it is firmly boiled togethe. It ests on two brackets boiled to the chase a frame no springs o dash pots are used.

# 1 GMC; 1 Driver, Displace 16 Horses; 4 Drivers; 4 Wagons

One GMC and one driver are doing the work that 16 horses 4 drivers and 4 wagons used to do for the New Dells Lumber Company Eau Claire Wisconsin

Starting at 7 o clock in the morning this GMC truck makes 20 to 30 trips a day delivering green mill wood over town under all conditions of weather

It hauls 3½ tons at a load and is always on the job

Estimate the cost of feeding, stabling groom

ing and harnessing 18 horses. Figure the up-

Then figure the weges of four drivers and con sider the employment problem involved.

This is a typical example of GRC trieds willity Your business may be different, but among the GMC models, ranging from 1/2 ton to 5 tone, is one admirably fitted for your work.

Behind every GMC is the backing of the General Meters Truck Company and its policy of plain houset quality

Let your next truck be a GMC

# That Line-Shaft Drive, an Advertisement—and the G.T.M.

The A C Horn Company, Long Island City, N. Y., used to have much trouble with one of their line-shaft drives On it even the most expensive double bells wore out in ax months. Before they wore out they often alipped off the pulleys or broke leaving idle all the labor and machines depending on that line-shaft for power. The drive was costing a lot of money for belts and belt repairs and more in lost production. One day Mr. Horn saw an advertisement telling about what a G. T. M. Goodysear Technical Man had done in solving a difficult belting problem—reducing costs and increasing production.

He sent for a G. T. M Our Mr Miller came studied the drive measured pulleys horsepower speed and the like. He noted that the air was exceedingly dry and that there was a great amount of lime dust—which accounted in part for the rotting and wear of the belts previously used So he specified a Goodyear Belt of Blue Streak Construction—designed to operate under just such conditions—and an inch narrower than those formerly used

The price was much less than Mr Horn had expected—so much less that there was some doubt as to whether a belt of such

modest price could meet the exacting conditions. But one was ordered and installed

That 5-inch 4-ply Blue Stream has already given half agains as much service as the most espensive belt they had ever used Still more important at has done away with the delays and dimmahed production that used to be so common. And it leaks good for many more months of trouble-free services

After that the G. 7. M. mente a plant analysis, every drive in the plant and prescribing the proper hole for it. Five of the recommended belts have already been installed. Every one of them has proved to be a strong endorsoment for the value of the C. T. M. a service.

If you have a difficult drive that either devours tee many belies or interrupts production too often—or both—sale a G. T. M. we call He il do it without charge when next be so in your visibility. There are many of them—all trained in the Goodyser Technical School—all with experience in plants similar to yours—all trained to sell belts to meet conditions and not see a grossy cells sugar.

# WHICH WAY?

A Short Cut for Purchasing Departments

Case 1. The purchasing Agent of a big company looked over his needs. In all, he wanted 13 distinct items. He sent out 13 separate orders to 13 different companies.

Note what happened: He received 13 acknowledgments. He followed up 13 companies for prompt deliveries. His Receiving Department reported 13 arrivals, checked 13 Bills of Lading and 13 invoices. The cashier made out 13 individual checks, to say nothing of the 13 envelopes the stenographer addressed and the 13 stamps.

13+13+13+13+13+13+13+13+13+13-Look at the cost in time and motion!

Case 2. Here is what is happening more and more in busy Purchasing Departments. Suppose 13 distinct items are wanted. It is frequently found that The Fairbanks Company can supply all these needs. One order is sent.

One acknowledgment is received. Generally the delivery is made in one complete shipment. One bill comes in. One entry is made on your books. One check is drawn.

Note the time and motion saved!

PURCHASING direct from The Fairbanks Company saves doubt as well as motion, "The Fairbanks Company O.K." is put on all articles sold by the Company. This O.K. means that the articles have been passed by The Fairbanks Company as O.K. in quality, O.K. in design, and O.K. in price.

"The Fairbanks Company O. K." is put on Mill, Mine and Railway Supplies, Valves, Engines and Pumps, Scales, Machine Tools, Power Transmission, and Trucks, and Wheelbarrows, and Automobile and Service Statton Equipment. It is backed by quality and service which have given The Fairbanks Company an international standing.

The more value you place on your time the quicker you will want to get in touch with the nearest Fairbanks Branch House.

# "What is packing anyhow?"

Ox r salesmen frequently comment on how often their friends, outside the humans ask the question.... What is Packing?

Some of the toless as to the meaning of the word are very amusing in their requiress and it is very seldom that the accurage mean realizes find what a big part this product plays in the afficiency and connency of the industrial machiners that is making the world better for as all

So for all its seeming insignificance the story of what packing is would seem to be well worth telling and well worth reading by anyone

As a starter consider Packing as something like the "washer' in your kitchen faucet. It prevents leakage—or ought to

Now whenever steam is put to work—or water, gas, brine, or ammonia packing is needed. It is needed to prevent leakage where glearning rods alide smoothly in and out of cylinders, for leakage here means not only loss of steam or water but, actual waste of power.

And mastle the cylinders of pumps packing 's, un saves power With perhaps two h n ired pounds pressure on one side of the piston, and a vacuum on the other; ston packing prevents leakage past if the piston.

And sheet pa king cut or molded into gaskets, prevents leakage at joints of surfaces or 3 p n<sub>b</sub>

So, fundame tally, packing guards against leakage

But when it werks against moving surfaces, pach; re subject to west-roc it goes "de ! and loses its clustrating This means replacement, shut down machinery of expense. So the buyer of packim, must ask not only "Will it prevent te lage but also "How long will it lear which of course depends on the material and workmanship put into it.

And there a third question, which the engineer will ask if you don't "How

much riction does it cause? I For some packings prevent leakage merely by filling up the packing space as addity as possible. Naturally such packing bluds the moving rod—sometime even scores it—and acts more or less as a brake. It is such sertious fautte as this that Johns Marwille has overcome through intelligent packing designs

So packing is not a thing to be bought at random—the right choice will save money by preventing leakage, by conserving power, and by its longer life.

As the pioneers in packing development we have placed packing design on a scientific basis, and out of experience, observation and facts have established a complete and standardised line that meets every plant requirement from among the minimum number of packings. Only in this way can packing be made to give a maximum of services for media to give a maximum of services for

Here is a partial list of Johns Mannells Pacifyings. See Blings for outside pocked Rods. Service Sheet an all around the John thoset pacifying Universal Politon for inside packed pumps. Kennerge balls men and handlade gadekts; Mogell Cell Packing for color stems and small rods. Singulitis Sheet for pacific gells are seen and maghine.

### Always On Its Toes

TOI infrequently in recording the progress and achievements of the Navy we have noted the fact that the Navy is always on its toes Notably was this the case in the matter of transatlantic flight No sounce was the armistice signed and the pressure of war servic removed, than our Naval Ar-Bervice bent steelf with redoubled energy to the task of praying that a scaplane could be built that would fly

That air-voyage from I ong Island to Plymouth by way of Newfoundland the Asores and Lishon will take high rank in the annuls of naval achievement and to the Navy will the nation is forever indebted for the dison which has come with the construction of NC-1 and the skillful pilotage of Commander Read

It was fitting that this distinction should go to th ountry which gave birth to the art of mechanical flight The Wright brothers found so little appreciation of their spech-making invention among the financiers of their own country that they had to go to Lurope before they could secure the necessary emouragement. We have changed all that, however and to the Navy belongs the credit for bringing to the native land of the airplane, the blue ribbon of the acreal seas

fore these lines are in print it is probable that two of the contestants for a straightnway flight from con-tment to continent will have made a successful landing in kurope or dropped into the sea. Both are military bombing hiplanes and both are driven by Rolls Royce engines. The NC-4 made her trip with Liberty motors, and so the contest will give a good line upon the two types of drive The Vimy bomber has two, the Hand-

ley-Page four engines Granted good weather and clear skies for navigation, and the question of winning ir losing is entirely one of the endurance of the Rolls Royci engine. We far as we know, it has never been put to a test approximating this one in severity

The N( 4 and thus Handley Page bomber are huge machines but the end in size and wrights is not yet. The Tayrant triplane built by the Royal Air Force with its weight of 22 tons its lifting surface of 4 950 square feet, and its six engines of J 000 combined home power is so much greater as to be in point of dimensions in a class by itself. This machine would not appear to be available for transatlantic flight, for with 10 000 pounds of oil, using all engines with full throttle the endurance at 11d miles per hour would be only 900 miles Using four engines and throtting down would enable the machine to cover 1,200 miles, which is about 750 miles machine was badly wrecked Necessarily, the superse will encounter its most serious problem in eatter of starting and landing

## Think Nationally

T was easy for us to understand why anything so radical as moving forward the hands of the clock should have been looked upon with suspicion by the conservative public before the experiment was made The idea seemed fantastic in the extreme But why should there be any opposition to the conservation of daylight now that the measure has been given a fair trial and has proved so popular through the country? This we fail to understand

It is true that daylight saving was adopted as a war measure to conserve fuel and as a war measure at paid no attention to public convenience or public prejudice When however we had experienced the blessings of an added hour of sunshine in the afternoon it seemed to us that the new summer time would be a permanent metitution On every hand we heard the measu commended, hence it was with a distinct shock of surprise that we learned of the rider placed on the Agricultural Appropriation Bill last winter For tunately it was a simple matter to dispose of the rider on a point of order and we had h ped that opposition to daylight saving had been d finitely and finally killed But the Committee of Interstate Commerce has repo a repealer as a separate measure and probably before this paper has been published the measure will have been considered and passed upon by the House

If not too late we wish t register a most vigorous protest against any attempt t repeal the daylight saving measure. We have trud to look upon the ire impartially and to weigh as carefully as possible all the arguments against it but we have been unable to find any ground for its repeal and we cann prehend the motives underlying the opposition to the measure Apparently the farmer finds daylight saving irksome, but he shows no disposition to adjust himself to new conditions He does n ! t ike the matter seriously but looks upon it as a new funded notion which is a bother to him and of no real I neft to the country at large. It seems strange in | I that the man wh day is long as that of the sun whi is out in the open from dawn to sunset, shoull d anything to prevent men who are couped up in city ff is and who have to tuil in factories, from sharing with him some of the benchts of cutdour exercise Why should the outdoor man want to keep the tist ir man in? The whole apposition seems to be due t a narrow point of view on the part of the farmer We would urge him to think nationally as Rosevell put if Any farminds d man who considers the measure broadly from all points of view cannot full t scales the immer advantages to the country at large of starting work earlier in the day and closing work earlier in the after-

I his country has always been very fair to the farme He has had practically ever thing he has asked for It in time he showed more considerati in for his city brothers, and we would also remind him that it is the ex farmerthe man who was brought up in the country and who loves the broad outdoors and who is now obliged to and has tune in the city—who is most enthusiastically in favor of "summer" time

### What Shall We Do with Our Shins?

HE shiphuiding program has been greatly reduord since the againg of the armistice the Shipping Board having suspended or cancelled ntracts for 754 ships, aggregating 2 532 000 gross tons contracts for 772 imps, aggregating a one a para-We have built and expect to build 2 444 vessels, aggr-gating 9 187 000 gross tone, the total cost of which will be 21861,755 570 The total sum authorsmed by Con-gress for new ships was 83,671 000,000 The Shipping Board asks for a further appropriation by Congress o m of \$673,868,301

What does the nation wish to do with these ships? It is with a view to getting an answer to this question that Mr Hurley has followed a policy of frank dis-closure and discussion. Through the press and on the platform he has made known the policy of the Shipping Board, and the country has been fully advised of the progress of our yards in turning out the ships Already we have a large fleet and it is growing by leaps and

The time has now come when Congress must mine what disposition shall be made of the first, and for Congress to act it must know what are the wishes of

the country in the matter of control and use Manifestly, the first question to be decided is whether this great fleet shall be owned and operated by the Governsent or whether the ships shall be sold outright in the open American market and be operated by the individ-

open American market and be operated by the shattvar-ula or shipping companies who purchase them. With a vasw to obtaining an answer to this question, that should be representative of those interests that are most immediately concerned, Mr. Hurley has appeared before the more important commercial bodies throughou the country and recently invited them to a meeting in the country and reconty invite taken to account when the way which years for a joint discussion. The gathering was widely representative, the delegates representing every the country and all the leading associations that are concerned in the expansion of our foreign trade that are concerned in the expansion of our loveing wave and commerce. The gathering include representatives of the Shipbuilding and Shipping interests, the Marine Insurance companies, the Chambers of Commerce of the leading titles, the Trade Streams and Councils, the Imerican Experiers Association, the American Federation of Labor, the Farmers National Council, the National Grange, and representatives of the leading

It is impossible to do more than outline the general trend of the many opinions offered but it was evi early in the discussion that there was a practically unanimous sentiment in favor of private as against Government ownership and operation What feeling there was in favor of Government control came from one or two representatives of labor and the agricultural interests. It was noticeable that not only did the speakers who have a working knowledge of the shipping business advocate private ownership and control, with kederal assistance until the new venture is firmly upon its feet but they insisted that, so far as operation was concerned, the purchasers of the ships should be allowed to operate them entirely free from Government rierence It will be remembered that the proposal of the Shipping Board called for provision for a general Board of Directors in Washington, which should include a Government representative sitting as member of each Board of Directors of the purchasing company

mourt or Laretters of the mosting that all the wooden ships should be sold in the world s markets, and that all steel ships of less than 6 000 tons should be disposed of, 5,000 tons being the smallest size that can be operated to advantage in the foreign trade. The speed should be not less than 12 knots, and higher than that for special routes notably those to the principal South American

It was urged that, if the merchant marine is to be a success, it must be popularised This can be done in two ways By a well-organised campaign of education and ways by a wide distribution of the ships around the whole coastline of the United States Each port in the country should form shipping companies for the purchase and operation of the vessels and an effort should be made operation of the version and an enter all the state of the get public money into the local shipping companies. The Shipping Board should see to it that the ships are well distributed and that they do not all go to a few of the leading porter a most important point if a wide national interest in the movement is to be secured Strong emphasis was laid upon the need for a broad

varying unipments was laid upon the need for a broad Federal Charter for the ships. No State should pass dibetembanical law. There must be one great National shipping, not a series of local and independent State offeris.

therto the indifference of the Middle West to the Hitherto the indifference of the Middle West to unsuppositing of the merchant merus has best the great stumbling block, but it is believed that the war has served to enlighten the farmer. He has leated how the served to enlighten the farmer. served to enhalten the farmer. He has leasted how greatly he was hampword by our own shorten of ships. The Prendent of the Kanses Agricultural College said that the farmers were already taking a breader view of the question, that they are not in favor of Government ownership, and that, if the true facts of the shipping situation as affecting their particular interests is con-ormed are made often to them, they will favor the granting of Government seaftance in the pioneer work of establishing our flag on the seven sees.

## To Our Subscribers

OUR subsettlors are requested to note the expiration date on separa of Sonswerre Assureant. If they will send in their renewal endows at least two weeks prior to the date of expiration, it will add us greatly in rendering them efficient service.

## Electricity

Iron Fipe as Conductor.—The 94,000 km. 68,000volt outdoor substation at Hog Island in one of the many substations built during the war in which tron-pipe conductors are used, states the Biostoical World. In that installation all primary conductors except those to transformer terminals were made of iron pipe. Other compands in different parts of the country used from pipes for high-tension bushars and for primary connectuous in substations. The parcelos has proved as satisfactory that many companies are continuing to use iron pipe for these purposes, though the war restrictions on the use of copper have been removed. The iron buses on outdoor substations are usually patvaniand.

Fires Due to Wiredess Waves.—At first thought it soems highly improbable that any fire could be searched to the effect of wiredess waves, though it is concervable that, granted certain specially favorable conditions, the indings of a spark between adjuvent metal parts might have such effect. M. Le Roy in a rocent issue of the Compite Rendess describes capturements intended to test this point. He had met with several cases in which fire did appear to have been caused by wireless waves. Accordingly, he constructed an "inflammable recentary by the aid of which he did succeed in setting fire to paper, ection wadding, and other substances. He thinks it possible that in certain condutions inflammable substances, such as bales of cotton bound with hosp iron, could be set on fire by wireless means.

Electrical Effects in Vibrating Wires.—A rocent communication to the Proceedage of the Rayal Scosety by Admiral Riv H. B. Jackton and Dr. J. B. Bryan zeles to the effect of the surface of vibrating wires on the electric currents penerated in them by the earthst magnetic field. Butting, for example, diminishes the current, but the decrease is not entirely due to smaller exitional area. Surh currents can be detected by search coils, and somewhat similar effects take place in tribrating plates. The effect is not produced in son-conductors, but it seems to be accepted by the authors that, after allowance for the effect of motion in the earth's field, there still remains an effect which cannot be accounted for. In any cass mach affect may be of appreciable consequence in telephone and other circuits in which intermittent currents are involved.

Shock-proof Tungsten Lamp. Despite the many improvements introduced in the manufacture of tangsten lamps, they have remained delicate until the present to be handled with extreme cere to swid parting and shattering the delicate Blament; but in more reachings the many that the the tangent lamp has come to be fairly ranged and available for almost all purposes save in mile, printing plants, and other places subject to intense pounding or shocks. It has remained for one of our leading electric lamp manufactures to introduce a new type of tungsten lamp which incorporates a shock-abording feature. The filament mounting, instead of forming an integral part of the glass stem as is usually the case, is spring supported. This feature makes this lamp serviceable and preferable under almost all conditions where earthen lamps have been used hereofore.

Bubatitutes for Rubber-Insulated Wires. —In a recent issue of a German periodical there is an interesting dismusion concerning tests made in various "war wires," particularly in respect of mechanical strength and resistance to moisture and heat. The insulation on the wires investigated consistent of responsibilities of the property 
## Astronomy

Four Fertadic Comets, all of short period (615 to 8 years), are due to return this year. This following approximate dates of parthallon passage are given in the Observatory: Connet Finlay, October 6th; comet knoff (1000 IV), Reptember 2d; comet Holmes, December 1st; comet Schaumasse (1011 V). December 1oth These comet Schaumasse (1011 V). December 1oth These dates may be considerably in error, as allowance has not been made for parturbations.

The Astronomical Day.—The movement in behalf of making the astronomical day beyon at madmith; as as to eclaride with the civil day, has borne fruit in Great Bertam, where the Admiralty has just given metru-times to have thus reform adopted in the Brutah Nautural Almanae, beginning with the sense for 1926. This step-was taken after consultation with the Ravaja Astronomical Nociety, which, in turn, consulted the supermittedents of the sphemerates issued in other countries and vasious other astronomical authorities. According to Nature the change is made makinly for the benefit of seames

The Weather Data Needed by Eclipse Expeditions. In connection with the coming solar selipse of September 10th, 1925, the path of totality of which ero Maxico, Prof. W. W. Campbell renews a suggestion which has been made by Professor Todd and other astronomers; vis., that weather observations should be nade along the prospective shadow path for a few years before a total eclipse, not only at the season of the ye in which the eclipse is to occur but also at the hour of the celipse. The observations made at the regular termhours at meteorological stations often give an entirely erroneous idea of the kind of weather likely to be encountered at the time of an eclipse Professor Campbell says that the data supplied to prospertive observers of the Russian sciepes of August 21st 1914, were based on cheervations made in the morning and evening, and gave fair promise of clear skies for the event After the eclipse parties reached Russia they were surpresed to discothat while clear weather was the rule in the evenings and mornings and at night, cloudiness generally prevalled in the middle of the day, reaching its maximum at about the eclipse hour. The lack Observatory would not have sent an eclipse expedition to Russia if this con-dition had been known. In connection with the Amerian eclipse of June 8th, 1918, the data prepared by the Weather Bureau based on morning and evening observations, gave no token of the fact that in certain localities essected by eslipse parties very troublesome high winds normally prevailed during the period of the day in which the eclipse occurred. Those winds gave res to distressing dust storms.

Dark Markings in the Sky .-- Professor Barnard's descriptions and discussions of the numerous dark markings in the sky—possibly non-luminous nebula have already been mentioned in our columns. In a recent number of the Astrophysical Journal he again takes up this interesting subject, and gives a catalo of 182 of the markings in question. He believes that some dark places seen in celestial photographs are actual some care place when are unquestionably due to intervening opaque masses. Whether these masses are gaseous or non-gaseous remains problematical They are not confined to the region of the Milky Way. Thuse which cour in that region are not necessarily devoid of saity, for they may appear black by contrast with ight background. Elseutere, however, there are the bright background. numerous examples which are perhaps entirely dark. Their visibility leads Professor Barnard to suggest the "space itself is probably filled with a feeble light who forms a slightly luminous background for these day. bodies." Two regions of the sky visible from a intitudes are especially rich in dark markings, vis , 1) the region immediately north of Theta Ophiuchi, and (2) the region of the great star-cloud in Soutum near the cluster Mil. Some of those found in the first-name region are so strange in their shapes that it would be difficult to match them with similar forms among the luminous nebule. Professor Baraard recalls the fact that as long ago as 1894 the late A. C. Maynard, then editor of Knowledge, in discussing one of Barnard's hotographs, declared that certain dark vacant areas m to be undoubtedly dark structures or obscuring "seem to be unacupusly cark structures we obscuring masses in space, which rut out the light from the ne-bulous or stellar segion behind them." It would be interesting to know whether any carlier suggestions were made to this effect by astronomers.

## Aeronautical

New Altitude Record. -On May 28th last, Adjutant Casale, a Franch systata, in a fight for altitode accorded 31,000 feet. This remaitation a would's record, being 500 feet better than the flight of Capt. Lang of the British army whom January last user-add to 30,500 feet.

Long-Distance Photiess Plight. For some time experiments have been carried out in various countries with the object of controlling air raft from the ground, and according to the Journal a French machine successful and prescribed countries with certain specified defours—in covering a distance of 150 kilometers (about 10 miles), and in landing, when required, in a certain surdrome. A similar machine has been developed in the United States which, according to a recent statement of Secretary of War Baker, can travel without a pilot some 100 miles and land close to a designated post.

Argantina's Aviation Instructors.—Argantina has awatered for worn, and does not new doubter instructors from the United States. Some Argantina officers are now abrund studying avation in preparation for returning to their own equatry to act as instructors in military aviation. This advice has boar reported to the Secretary of State by the American Consul General at Banesa Aires, in response to a request from the Argantine Minister of War. During the past two months American avators have been offering them reviewes to 'transition are prospective instructors in flying, but found that they were not needed.

The French Safety and Comfort Competition.— The provisional list of stages to be followed in the Relode Parts tour of France competition, to take place in the early autumn, has now been mapped out. Machinaswill start from Pars, and will be obliged to stop at Tours, Nantes, La Rebelle, Bordeaux, Barriti, Toulouse, Barcelona, Nimes, Antibes, Turns, Frojus, Avignea, London and Islie, ending the journey in Paris. Two of these stages may be flown in one day. The total distance to be covered will be more than 2,700 miles, and the prizes will aggregats some \$60,000 00

The Peace Treaty and German Aviation.-In lancing over the official summary of the PesceTreaty, one finds the following rulings with regard to German acrial activities. The air clauses provide that the armed forces of Germany must not include any unitary or naval sir forces (lermany 14, however, to be allowed to intain a maximum of 100 unarmed scaplanes up to October 1st, 1919, to be exclusively employed in sea mg for subnuring name. The entire personnel of the air forces in Germany is to be demobilized within two mouths, except for a total of 1,000 men, including officers, which may be retained up to October. The aircraft of the Albed and Associated Powers are to enjoy full liberty of passage and landing over and in the territory and territorial waters of Germany until January let, 1923, unless prior to that date Germany is admitted to the League of Nations or is permitted to adhere to the International Air Cunvention The manufacture of aircraft and ports of aircraft is forbadden throughout Germany for un mouths. All imbiary and naval aireraft (including dirigibles) and acronautical material are to be delivered to the Albed and Associated Governments within three months, except for the 100 sexplanes already specified General articles provide for the modification of German laws in conformity with the receding clauses. All the clauses contained in the Treaty are to be executed by Gormany under the control
of the inter-Allied Commissions, to be specially appointed by the Allied and Associated Covernments for which the German Government is bound to furnish all noce facilities and expenses of upkeep. The duties of the Military, Naval, and Aeronautical Commissions of Control are laid down in detail. Aircraft of the Allied and Associated Powers shall have full liberty of passage and landing over and to German territory, equal treatment with German planes as to use of German aird and with most-favored-natura planes as to internal commercial traffic in Germany Germany agrees to scoupt Allied certificates of nationality, airworthiness, mpotency and beenses, and to apply the convention valutive to Aerial Navigation concluded between the Allied and Associated Powers to her own sireraft over her own territory. These rules apply until 1923, unless Germany has previously been admitted to the League of Nations or to the above convention.

# Steel Wheels by a New Process

# A Combination of Rolling and Forging that Gives Good Results

By E. F. Cone

A ROLLI D steel wheel is now being made in a large western Pensylvania steel mill by a method and apparatus radial ill different from sarylang herestore. It re called a rolling forging process. About 15 years sold side of rolling which were made in the United Busies from a flat steel side. Yuch a blank was pumphed tast presend into shape a flat sylundread form a fundamental form and the United Busies insuited in a rolling mill. This procedure was an adaptation of continuous Lucapean types of rolled whost

PAY

projects one die towards it iompanion die and an elestric motor which san di vilop from 1,000 to 2,000 horre-power or thereshows the periodist on the san and assount of work to be done on the blank, is provided for rotating one of the angularly disposed dies which by fretton also rotates the companion. It which which is almost the companion of the san and the san the san and sanuses the reverse form of the done at he presente and essuarse the reverse form of the done at he presente and rotation continue. A little to the done of the san and rotation continue.

nue A thrust of 3,000,000 pounds or more is taken up by thrust bear-ings which are behaved to be the largest in the world. This method has the idvantage of rolling the steel has the advantage of rolling ton most under cumulative pressure thus working every portion of the blank into a whill or other annular shape. The time required to roll a blank ans sime required to roll a blank into a wheel varies from 20 seconds for the smaller sizes to about one minute for the larger sizes.

There is provided in the blank a shall a such a second size of the size of

There is provided in the blank a slight ansetut of excess material, which is solid out in the edge in the form of a fin When the rolling is completed, the whoel is withdrawn from the mill and placed in a fin sharing machine.

In the operation of this shear, a har, which is preferably epinedronal in shape, is deposited on the skide and rolled into the space bounded by the side guides. Here it rests upon the long supporting roller, which is then postavely rotated by the electron motor and connections in the direction of the rotateous of the hear when being set. The pusher them moves the her forward until its east rosts against the holder adjacent to the shear knives. The shear heads or dates are them rotated in a counter-to-clockwise discretion. As the shafes rotate channel facility of the state for the damastrically may be a shear than the state to the state that the state that the state that the shear is the section, the shear hardes of each state that the state of each state that the state of each state that the state of each state of the state of the shear fairties and the friends divines action of the supporting roller, which is positively drives, as mentioned. One of the unusual products is a rolled double-flange 3d-lind crash wheel. It is first rolled in the wheel mill with a flat tread and this them introduced into another special tread-rolling mill in which the tread and this freedore, wheels of the land have head their treads machined of the marked who are the state page. This automatically pides up the finished whose as they come from the machines.

Box Handles of Wobling to Save Shipping Space
IN suport shapment, house loaded with 200 to 200
pounds are incet easily manipulated when provided with
handles. Unaulty such box handles are made of crops,
unserted through holes in the ends of the heart of the
second with wall knots the ends of the heart of
on the under set held in place by mails or servers
here the brought the classe.

The former method of fastening has the diadvantage of taking up valuable space in the
interior of the box The latter increases the
thankness of the clean to provide for a groove
of sufficient depth to hold the rope, thereby

of tread rolls

The new process begins with a standard-uses impoland rolls in an large to-chigh mill, thus producing a
scalar rolls in an large to-chigh mill, thus producing a
crimitrous in from 11 inches to 20 mobis in diamstandard of time 1 for 10 inches to 20 mobis in diamstandard of time 1 for 10 inches to 20 mobis in diamstandard of time 1 for 10 inches in product of 1 from this large bety means of a rolary
shear mto which the hot-rolled cylindrad bar is introduct of 1 for alores thus out our stifer another from
the mod of time bar produce blanks of any suse or weight,
dappied to be finished into a wheel or gene blank
Those blanks have an outer cylindrical surface of
the steel arranged in radial relation. The rolary shear
takes the place of older methods such as using fast slabblanks, short ingots or longer mgots cut into blanks in a
lable.

These blanks are heated in a heating furnace as These blanks are neared for the high carbon stel used in gradually as necessary for the high carbon stel used in making the wheels Hetwen the furiace and the whol-mill proper as a presumagn machine which properts a short steel punch or mandrel part way into the center of the blank, making a cylindroal opening in the centre thereof. As this hind, is introduced into the wheel mill street. As that blank a mirreduced into the wheel mill alone up one manded with its previously placed in position in pregented into the operating and as the wheel in pressed and fould in the whot mill the manner! sold to be blank centrally in position and at the same time many portion of the length of the bors of the wheel ready not the milling and until the blank has been withdrawn from the mill milling and until the blank has been withdrawn from the milling and until the blank has been withdrawn from the milling and until the blank has been withdrawn from the milling and until the blank has been withdrawn from the milling and until the blank has been withdrawn from the milling and until the blank has been withdrawn from the milling and until the blank has been withdrawn from the milling and the wheel of the milling and the wind the milling the milling that the milling and the milling that the

rotary shears and the mandrel is pushed out and the punching of the hore finished as shown in the puture

hore finashed as shows in the peture on page 551. In addition to reling freight, passenger, electric and other car wheels, this mill is also particularly daspied to reling gear blanks and automobile flywheels and in espe-nally useful in producing solid tellid wheel canters such as have been used in forces countries for many vacan

whele casters ruch as have been used for gang countries for many years and to which separate sizes are fixed. The relaxy shaar as decayed to cut large bars quasily m order that all the blanks may be set from one bar before the next bar as delivered from the mill and also to set these while the bar as still just. Bash blank is set un about eight seconds. The length of the feed apparatus as about 60 set, and the length of the feed apparatus as about 11% feet in the length of the search and the set of the engage and the length of the search parameters about 11% feet long. The width of the shearing machine is about 15 feet over 11% the height 11 feet 5 noises above four-dation and the weight approximately \$40,000 pounds

The white-het blank in position between the eller which will green it into the wheel form.

## Motion-Picture Colony Under One Roof

THE motion-picture mdustry has grown so fast that it has burst its environment and spilled over into any place where room could be had As a result, the average motion-picture con-cern today has studies scat-tered through city suburbs and far out in the country wherever land and space sould be obtained. Thus one downtown, laboratories up-town, a workshop in the business district, a storehouse in the factory district, and a property room in any avail able spot Needless to say, this has been far removed from anything like efficiency

from anything like efficiency there has been a vart amount of lost time, wasted energy, accessive out in cartage, lighting, telephoning—in a word, a great waste of people and things. The perfecting of the motion-picture industry in a business sense, so that many perfected units may work together in full efficiency, as solut to be epitomized in the new building being serected in New York city by the well-known producer, William Fox It is probably the first time in motion-picture history that the

time in motion-picture history that the three leading branches of any producing organisation—studies, laboratory, and ad ministrative office—have been brought together under one roof for the elimination of loss, delay and fraction it will be a little city in itself; an aggregation of all things essential to the production of the production.

photoplay
The film selony under one roof will be located in the vary heart of New York two munutes from Broadway, at 50th and 56th streets and Tenth avune it will spread over a city block, or connewhat over four sores of land. It will house an army of 5,000 workers and will have a producing sapacity of 3,000,000 feet of film per week. This film city under one roof will among the largest in the world

among the largest in the work.

The comming motion picture colony will consist of three stories and a basement, as contrasted with the 20- by 25 foot studies of a few years ago. It has been laid out along scientific lines by authorities. on factory and office construction, with a view to speed, economy, and concentration in every possible phase of efficient motion-

in every positive prime of officers incom-pleture production, from filming to book-keeping to stenography and to starring In the basement of the building will be a high-pressure in the nasement of the building will be a nigr-present boiler plant capable of generating 500-horse-power, a number of enormous coal bins, and a great room fitted with complete electrical equipment for such a building There are to be extensive quarters for laboratory re-Eners are to be extensive quarters for laboratory re-search work, where a staff of chemical and photographic experts will devote their time to devising and im-proving mechanical ap-peratus and chemical for-

paratus and chemical for-mulas for the perfection of photography, film develop-ment, thing and printing, and to general experimental work for advancing technical

The prise spot of the whole building will be the top floor, which will be in the form of a giant studio that will allow panies to work simulau companies to work simul-teneously-companies that have heratofore been scat-tered widely and expensively. The roof will be supported by flying trusses, and not a pillar, jost, or obstruction of any sort will prevent directors any sort will prevent directors from netting up concery wher-svarthey wish. On this floor a director can stand in the center and point to anything he wants to make his plo-tures operatly—things he foreporty had to send many railes away to get. Eart

Piling the finished blanks with electric transfer tongs

will be stages both revolving and stationary property and costume rooms, shops for carpenters seene and plaster shops, 20 camers dark to ms and dresung rooms to accommodate 1,000 players. The last word in lighting equipment will be afeature of this studio and it is said that the cost of this apparatus will be over \$150,000.

Safety first! That is the theme throughout the 199 Parison. 018

Removing the circumferential fin and punching the axie hole

planning and construction of this unique motion-picture building One unusual feature will be the air condition outsing One onsatal rescure will set ne air condition ing plant, which will supply washed air for the whole structure so that the sake temperature will prevail throughout the building during all seasons of the year and working energy will be assured by constantly cool moving fresh air. The structure is to be fireproof of course, being built of heads, concrete and stool yet at no time will a person be farther removed than 100 feet from an exit. Moreover the vamps or inclinited roady syswill extend to each f the mployers and vehicles and It will a night to prevent jun during a hurried empty ing of the building

One roof will house the Lig notion picture colony Already the foundation has been laid and the structure is being rapidly pushed to completion. The building will be occupied by film editors, directors scenario writers office force the various film artisans and so on and will contain 35 fireproof and waterproof vaults where negatives and prints will be stored, 12 projection rooms which are to be per feet theaters in miniature

with muse and cushioned scats rest rooms, proporty rooms and dressing rooms for 1000 players. Not least in importance will be the laboratory and research department which will ensure accuracy in the various details of photoplay. The accompanying illustration gives some idea of the unique motion-picture studies. as it will appear when completed

# The Friendly War After the War

## Well Laid Plans of British Manufacturers for Exploiting Foreign Markets By David McFall

WHEN Great Britain threw her weight into the scale has August, 1911 not one Briton in a thousand shared Lard Kitchen is view that the war would last shard Lord Kitho at a var w that the war would hast three years. The mate in the street was so impressed by the magnitude of the conflict that its long continua-tion seemed to how impossible. The general optimizan-was reflected everywhit? Many of the London slope mad war deplayed a placard reading. Dismoses as usual during alterations of the bush to the Prince of Wales Rate! I und contained page for but four months. And innumerable other histograms of the reflected the same consistent.

months. And innume able other little manifestation beam computum.
Indeed, during the entire conflict even when it impatiful cosh beam apparent the good over yutterasse was, "Bunness as usual." While the form of industry was changed necessarily the reconstruction period froption. It was foreseen that, whatever the disabilities imposed by the war this period would at the same time present greater difficulties and offer greater opportunities than were ever known before the way the period of When America entered the conflict removing the last vesture of doubt as to its final outcome, drums of com vestings of course as to the majorate mean actual plans in these plans are now coming to light. The lines industry of north lealand about has allocated to adversaing purposes in America a sum approximating \$200,000. The intentions of many other great British industries are no

## The Federation of British Indi

The Federation of Breach Industries

No doubt the must important styp takin by Britash
manufacturers in res int years was the formation in 1916
of the newton in res int years was the formation in 1916
of the newton in the Britash Industries. This
organization is directly that the organization is directly as a size of a size of the size of t individual firm to take whatever advantage it can from

I be better roaditions thus or ated

I be keynote of the lederations task is found in a the keynone or the 1 decrations I task is found in a angle word—publicity. The largest ixpenditure of money, the employment of the best takint and four fiths of the machinery of the organisation are directed toward this end. In the singularly comprehensive publicity campaign that has been plained and that is some put into immediate and vigorous effect there are been put into immediate and vigorous effect there are being put into immediate and vigorous thet there are four outstanding feature—a stree of intrinational expositions, personally conducted tours through British industrial contern, a fuller use of the moving put ture film and a thoroughly organized newspaper and periodical

### The British Producer and the Foreign Buyer

Since the opening of the first intrinstical exposition in Crystal Palace I endou, in 1881, Great Britain has had a greater number of su ceasile expositions than any other one country, though to America must go the credit of having staged the largest and most attractive ones. In the matter of expositions therefore British manufacturers are hardly in position to instruct their American However the l'ederation has adopted an competitors However the Indonstron has attitude which is just resting and suggestive setting on put or two large expositions which experience has shown to be two often men attractive to pleasureseekers and curroutly attention than to reconstructed to seekers and curroutly attention to the students of mounts of proposes as new of smaller expositions as of-more, complements of a seal students of the students of saylving other than of those will be an Anglo-Greek Lapsenton to be lid in London in "Syttember and for those or the sear A representative of the Federa-tion is now a student of the search of the search too is now the search of the search of the search too is now the search of the search of the search to the search of the search of the search of the moderation of the search of the search of the powerty-ster, and the search of the search of the search of the start has condition of Greece and her industrial backhas shown to be two aften more attractive to I

waruness
The matter of arranging for personally conducted tours
through the principal industrial centers of the kingdom
promises to be muck more fruitful, as well as less couly On April 10th a special representative of the Lederat On April 10th a spr real representative of the I cheration shade for Brand, a country with which it is familiar through king residence, empowered to crit ad to Branilian importers personnal mirations to wate Orac Britan During the whole of the trip the Branilians will be the genetic of the Rederstion. To avoid the rook on which any such educational mission is apt to split, that of

favortism in being shown certain industries to the exclusion of others, it is planned to have the itinerary cover the entire Kingdom imparitally. In each indius trial center the manufactures and their organization as business with the metric to meet the victories both information in a business with a property of the contract of the metric of the contract of the co of lasting value. It can search that to be immediately productor, as no one in quest of trade can cashly refuse it whin it is sugar-coated with hospitality. The fact that the Federation has selected a bouth American republic for its first expariment of the kind may be rather unpleasantly suggestive to Austrian manufacturers

## Cinema Service for Manufacturers

Cisman Bervise for Manufacturers.

Perhaps the most intravel ng proposale—for at this stage they are most proposale ruler than accomplained fat te—art those relating to a fuller use of the motion posture film as a means of revilating information concerning Braths indistrates. Here refore the film has been much more largely used in America than in Great Bratism of rehowing industrial scenes and prote seaso. The reason is obvious. Owing to America a great order inside the stage of th sans, lumbering in the far Northwest and other pursuits, are not committy as new to the great mass of Americans as though they were carried on in foreign countries. This cannot apply within the narrow bounds of Great Britain, where every form of industry however a gregated or localized, is almost within valking distance of every other Great Britain has also labored under an irre-movable disadvantage in the 1 velopment and use of the 1 Due to climatic conditions American films are so the sharper and clearer than British films and there i mure pleaning, that it requires a subject of excep ore mire pleaning, that it requires a subject of score tonal interest to create a price rate for the latter for these and other reasons the limits public hear securious itself to looking upon the film as an interesting usough amusement device but not as one having any great odiucational potentialities.

One of the reset tests of the contraction of the c

columnical potentialities.

One of the great tasks the 1c is ration of British lindustries has not itself as to remove the British masonic plain as to the value of the film, and 1 urge a fulling use of it is all substrating how acrously the divergrate views the problem the following is quived from as used leading written pamphele: "Bound the World by the Film," recently issued under its direction.

Dis losits are of the cust may not be made a great medium of national advertor must. Producter of films and the courter have not because it and the courter have not because it and the films.

in this country have not been given the same farihites as in America, France, Italy standinavon and Germany for recording on the screen stress of national life and industry Abroad the man with the camera has been made welcome everywhere. In the United Kingdom has been commonly treated as a nussane or as esgaged in some frivolous pastims meaning softling to solid human as

Within a few years reader attendance at preture the attres has become an ideased universal habit. In Great Herian there are over its chandred million patrons per annum or twelve times the total population. It as a extraordinary anomaly that were 90 pretent of the films shown to those people are of foreign origin. What would be thought of a great country whose, nowappears were 90 per east foreign-controlled and representative of foreign mentality? mentality?

mentanty!
Inidicatelly, the pamphict in quarion pays America
this emphatic compliment
' Phrough the remarkable enterprise of the American
emona trade the United Stat's is by far the best adverthoms trust the United States as by far the best adver-tioned constry in the world 1 stry, day millions of people all over the globe have 1 of a their two American sons ry, American heroes as it better a business midu-tral and source have grounds where fast over farms and households, and American tests in all manner of articles

In the undeavor to attain f r Britam at least a part of In the indexport of attain f : Britain at least a part of the advantages which Amer, in owe range no fully, the Bederation makes several pra itsal concrete suggestions to the constituent member. Correspondence with thousands of manufactures was invited in a circular containing the following questions:

"Are you willing to give o canonal facilities at your office or your works, so that the producers of story flims may avail themselves of British industrial backgrounder."

Do you make any general exception or qualification in regard to certain departments, or any limitation of time compared? What features of your business do you regard as being particularly satisfuls for this purpose (e.g., interesting processes of manufacture, convenient or certain processes of manufacture, convenient or country of the processes of manufacture, convenient or country of the processes of manufacture, convenient or country of the processes of manufacture, convenient or posterior processes of the receiptents, at most But since all who reserve these questions are members of the organization conducting the questionname, and as each member has preceding the control of the processes of average speciator veves a film restroired to the acolustre portexpal of a single moderty, it at once necess to hus, at least sub-constroucy that it is a pad-for advartagement but when in connection with it is shown a background of picturesque or historic interest—and nearly overy British modistrial enter has such a background—the industry itself derives additional interest from its setting a tit he same time, and almost in the same proportion, all of the other typical industries of the consisty shaw in the benefits of the set extraorder, even though individually they might not be suitable for The I selection has nade another suggestion which is well worth acting on that individual firms make greater use of the portable properties apparatus by means of which their salazamen or travellers can demonstrate, in the offices of warrooms of the prospective outcomes:

which their salasmen or travellers can demonstrate, in the offices of wavercomes of the purspective customers themselves. It is pointed out that the requirements are quite simple—a small amount of wall space, preferably painted or papered in a high tin and a means of clos-tical connection, for which any ordinary lamp-bracket

In view of the strength of the British I ederation of In view of the strongth of the Britah I ederation of Industries and of the methodsal determined way in which Britah manufactures usually carry out the undertakings it is sale to assume that Great Britain at work will soon be figuring largely upon the severe. In-steed it is quite likely that even Amegican audiences well shortly be witnessing early morning processons of Manchester mill operatives with their shaws and dogs, or of the stack workers of Sheffield or the artisans in the ugly pottern.

## A Larger Use of Printer's Ink

More prosas: is the wider utilisation which the Federation proposes to make of the ordinary channels of printed publicity. Some two or three years age four separate organisations of manufacturers set up a body known as the Industrial Publicity Services and The States were held estirally by the participating associations, which were suited to service interest was obtained by the continue interest and the redemption of the arm service was obtained as the redemption of the service was been desired as the redemption of the service was now being a service with the service present of the redemption of the leadership Publicity Service and has taken steps greatly to writen at a pherical publicity flewing and has taken steps greatly to writen at a pherical publicity of the service was a service by extending to individual firms the kind of and rendered by extending to individual firms the kind of and rendered by extending to individual firms the kind of and rendered by extending to individual firms the kind of and rendered by extending to individual firms the kind of and rendered by extending to individual firms the kind of the revenue will be develoded to furthering the interest of the Federation.

The Industrial Publicity Service is now functioning structure of Strata industries, it is preparing technical end descriptive news matter for the foreign press, and it is preparing devices and version advertising media, (Constituted on page 667) More prosest is the wider utilisation which the Fe

# New Ships of the British Navy

# Influence of the Battle of Jutland Shown in the Latest Battleships and Battle-Cruisers

EVIDENTIA the British admiralty believes that the tra of keen e mpetition and seen y in warship designs and constent from passed with the passing of the ferrican fleet of the body has recently made julie design and construct non-process white cuttle making the feet man field. I it he if it has been cuttle made, jud he through papers r at l v l l the feometrucers before the Institution of ward Archeteria a remarkable complete statement of what was done cluming the war in the commence than of every kind of warship from devaduse construction or every land of warship from dwad-nought and hattle cruser I own to putted best. We publish her with a set of drawings also using the remova-turers in this great program which represents a total of about 4 we million tone and involved the laps inditure of about 51,400,000 000.

When the was opened in 1911 Creat Britain was completing the shape of the Ir of Duke class which carried ton 155-inch guiss in the turicts on the center I we of these were ready just before the war and line I wo of these were ready used before the was a-tile other two shortly after it tom. Due to the tossens learned at lithent a countershie amount of additional protection was added over the magazines of this Lasa-a change which was made in practically all of the capital ships at the same time. It is interesting to learn that ships at the saust time. It is interesting to heart that in only one case, during the engagement of heart that in only one case, during the engagement of heart that in only one case, during the engagement of the least that the first to mount the 18 tinth gun of which neght were carried. He speed was raised to 28 kinds and of two adopted in place of one law and the first of coal We are the coal of the engagement of the enga

gave and received heavy punishment hat were not seriously damaged or put out of action. Additional protection was given to the magazines as the result of that battle

The next battlesings in order are those of the Royal Novereign class whose de-signs were based on the Queen Flirabeth 1.3 make them more homogeneous with the majority of the dreadnought slips the speed was reduced to 21 knots but subsequently a change was made from cod to of and an its trains with 1,000 tons of oil the Revenge attained 22 knots which is equivalent to 34 knots at mean draft the thick protestave donk at the center of the ship was brought up to the level of the main deck

Particular attention was paid to underwater protection and, subsequently to their launching an outside buige

and, subsequently to their launching an outside builge was fitted to all the ships of this class. It is should be mentioned that the paper residence to boostly from which their particular and takes was given by Bir Lustine of the Victorial Victorial and Consecty, who was responsible for the builge method of predection and recumum used in for the Lustine class of vicesies in 1916.

class of vessels in 1916
The battle-crimers Renown and Require which as mark but ica written see originally lact down as battleships of the floor down-creen part but not seen the second part of the second part of the second part of the lact of th the battle-cruser type became very apparent and on the intentive of Lord 1 sher it was decided to complete the instantive of the property of the control of th

knois As a matter of fact, the Repulse made 11), knots in the deep condition and the Renown made 24 d knots speed at mean drift. I transfable record of 17 months for construction was me is in the case of these in vessels. It has hips are being will reported upon in their sea service and they set able to maintain their med

## Light Crissers, "Couragoous," "Glorious" and "Fund

While the doners of Renown and Repulse were withe the designs of Renown and Repulse wers in progress the sheef constructor recived instructions to disagn some with high speed abil a carrying powerful guns which were to be capable of maintaining the greed in moderate wanther but were to be of higher speed in moderate waster. But were in the same class, so as to be able to navigate shallow waters it so desired it was decided to build. Courageous and chonous It was desided to build Courageous and thorons on the lines or very large light runs is; giving them a five guns of the boavest radher, so that the would be also overtake and suit any assembly light runs or radie without some time that of a first light runs or radie without a large three professions of the courage and the state of the state

guns. They also carry an anti trip do armament of - PROFILE AND PLAN - PROFILE AND PLAN - . ---A HARRIST HE WAS A STATE OF THE PARTY OF THE

asvent. mounting. The maximum and protection the maximum and protection to that of the smaller light crusters. They also earry the modified bulgs below water.

I be destroyers unstabling fieldlis leaders, built during the war vary in length from 376 feet over all to 889/5 in the war vary in length from 376 feet over all to 889/5 in 1,200 teem, and the upset at lead during from 3,100 teem, and the upset at lead durit from 44 to 8 knote. These are contract speed unless in most chest waves greatly exceeded. The world's removal for destroyer good has recombly been gaused by a 'Argette books, which in a four-hour run at 86-simonthe has preceivity maintenant of the destroyers consents of the three and in the later destroyers from 45 knote. The streament of the destroyers consents of four or at 1,500 times and 65 knote, five all-fields given are carried consents of four or at 1,510 knote facilities. In a succeeding more we shall give all-streams and foil details of the "Turquessee" which is the destroyer that made the mean few-hour speed of 39,6 knote, shows mentioned.

## Marrie ...

The monitors built for the war samped in length and duplessment from 177 feet and \$25 tens to 405 feet and 5000 tens. The 355-feet weeks applied two dispi-or can \$3-feet gun, the larger monitors mounted a gain of 13-feet, 14-maje or 13-met gains.

British battleships buttle-ornisors and large light cruisers built during the war

## Blind Men in Testing Laboratories

N 1916 50 blind men war victims were placed in the IN 1016 50 bind men war vucture were placed in the flawwork abservatory part of the military maintion works of Spandaiu says a British trade paper. Here were first trained by women and later instructed by blind men. Originally they were only given very simple set work of the go and notego kind The disear monotomy of this compastors proved very had for them however as the scope of state work was gradually however as the scope of state work was gradually increased to the scope of state work was gradually increased to the scope of state work was gradually discovered. The scope of state work was gradually discovered. The scope of state work was considered to the protection, of course, the lathe is stopped for instance when the tool has done its work for the time, and the piece is automatically thrown into a hassiet for examination by jike nature. Fraction thanges set scale in the scope of the scale of the scale year that year they were said to do on an average of 50 low, last year they were which which blacked seen could have done. Many of the men are superried, and the wively partly occupied in other departne to of the establishment act as their guides

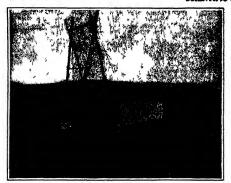

## Paper Bales Instead of Boxes

Paper Bales Instead of Boxes
THE scavity of shipping spaces suggested some time
ago that great saving spuid b effected by packing
textiles and all other soft sizes also in bales instead of
in cases
Many balable goods can be compressed to onshalf or one-third their original bulk thus effecting, a
reduction in freight elatigue, a total elimination of the
sort of cases and an economy in the handing. But the
substitution of bales for cases could only be effected
through the use of a thoroighly protective wrapping
blands the outer covering of burkap for the latter is
good only for the ability to hald that belt together and
must be supplemented by semething that gives watertightness. tightmens

tightness As the result of practices toots made by various bureaus of the Government, with some commercial assistance two types of waterproof paper have been

# The Non-Stop Trans-Atlantic Flight

Describing the Handley-Page and the Vickers Vimy Bomber Entries

THF non-stop trans Atlantic flight still remains to be realized at the time of writing. Indeed while the trans Atlantic flight has I on achieved by the United States Navy scaplane NC-4 there is nevertheless considerable interest still stached to the

siderable interest still stached to the various contestants now ready to under take the first non-stop flight between North America and furope. And the very nature of the non-stop flight as well as the huge prises to it claimed by the first successful attempt gives the present contest a real sportsmanship touch that never fails to invite populsar not rest

never falls to invite popular interest.

Iwo machines are now ready to undertake the great flight in fact it may be that one or teth of them will have made the attempt by the time this reaches the reader. At any rate one of the entries at the huge Handley Pag, while the other is the Vickers Virny Bomber Both machines are distinctly military machines both of them were constructed for the Bondbling Berlin. The auditor profits the purpose a mad the trans Atlantic flight context has given them a rail op portunity of proving the rworth Multiple-signed of the profits of the province of the engined reliable powerfully full great load earriers and fairly fast both entries are not far from ideal for the ordeal which they have set for themwelves

When the Handky I ago was constructed for bumbing Berlin she carried 1 190 gallons of fuel and a propertional oil supply a 200-pound wireless set 6 630 pounds f bombs 12 machine guns weighing 557 pounds and a cross f seven men. She made 90 miles pounds and a creev f seven men She made 90 miles an hour on her test flight with this load. For the trans-

Atlantic attempt however the machine has undergone some modification Her gasoline capacity will be about 2 366 g illons or n aiderably more than the N( 4 with her 1 900 gall ns This fuel capacity it is estimated will give the Handley Page a cruising radius of 22 hours of something like three hours leeway in making the Irish Coast with ordinary weather and no adverse winds

It is announced that the trans-Atlantic crew will con sust of four men-s pilot and observation officer The

n Universal a Universal Pneumatic-tired wheels of the Handley Page machine compared with a man and a boy

perience in long-distance, over-sea flights Frederick Wyatt of the Marconi organisat: n is to be radio operator. The Handley-Fage attempt is strongly suggestive of the successful one of the Un ted States Navy, for the reason that the matter is being handled in a businessitie.

long by 200 yards wice, and all of it has been cleared of obstructions and levelled and rolled, providing a hard surface for the hawly-ladent machine.

The new searchlight has a divergence of less than three-quarters of a degree, which corresponds to a width of 140 feet at a distance of one mile. The sainent features of the design may be found in the novel type of breech-loading cartridge mechanism and in the accommon and the saint of the mechanism and in the ac-cursory of its metal mirror. The magnetic control of the are parasited a much higher current density at the elec-trode tips, 400 amperes per equare into being situated, at 65 volts. The discussion of the residence market of

The Vickers Viny Bomber trans-Atlantic flight entry, which has a cruising range of 2 440 miles

carbon tips. When one stops to consider that the entire output of light rays must be 1 in hed in a pencil of light subtending an angle of 112 legiess some ries of the accuracy may be obtained.

Another view of the Victors Viny Bember, which carries 865 gallons of fuel and 86 millions of ell

This searchlight is the most powerful in the world, giving a beam of an intensity of over three times that of the most powerful searchlight in use at the beginning of the war, that is to say, for searchlights using a 60-inch mirres, beam intensities of 40,000,000 to 45,000,000 were

available whereas the new Lynn lamp gives 160 000 000 apparent beam caudi-power. The quality of light is far sperior also the spectrum of light approaching daylight mor nearly than any other artificial light sources. This of course more clearly reveals the clusive arriplant camunfaced and flying at high speed at a detacter of the rife is cought miles.

While the scarchinght weighs 1000 While the searchight waggs a vow pounds it was ne essary in order to make its movements m re-buly controlled by not more than two m re-ti-mount the entire device upon a light truck equipped with pneumati tir d whicels. The turntable and trumin a srm supports were of cast aluminum thus providing a very strong rugged and light construction. The mirror support is of steel in arried on ball bearings by means f a spoked wheel design and the breech custing which in turn supports the cartridge type mechanism and the occulter for warming before the beam is flashed on the enemy planes. The arc controls feeding mechanism ar striker etc are at the rear of the moth orientation f the team is accomplished by another man operating at the end of a

12 f or radius rid (arrying a michainer which facilitates the pointing of the beam.

The sarch highlight and supporting device required a self-contained and complete electric power plant with a contract capable of a 2b-kiloyard coupur fin order to produce this result a 185-inch.

In order to produce this result a 185-inch. This has

where these chansals was solected. Into has an eight-yhinder engine with maximum output of 80-horse power. An automobile generator with holl was aft and doble acting clutch was attached. The generator clutch governor and other details have a total weight of 650 pounds.

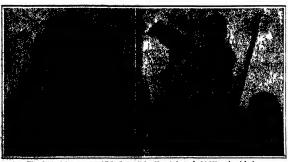

During the war the British used the gasoline-electric cinnibus taken from the streets of London and the French attached generators t the Renault trucks to provide a power plant for their searchlights. The new truck unit including the 60 inch searchlight was responsible for many im-privements. The overall weight was redured 10 000 pounds the speed moreased from 15 to 45 miles an hour and the cost reduced nearly 40 per cent. The new machines weight of ready for field service 9 000 pounds. This included fuel eightcylind r gasoline engine 21 kilowatt gener ator 300 feet twin cubk and reel switch-board the 60-inch scarchlight with carriage and the personnel of five men to operate

the unit

# One Hundred Thousand Horse-Power Steam Turbine

From Piston to Turbine-Reconstruction of a Great Power Station

IN the Scientific American of January 11th, 1902, there was published on the front page an illustration of from page an illustration of one of the sight great recipro-cating steam engines which had just been completed at the new 74th Street power station of what was then the Manhattan Elevated Railway Company Each unit 8,000 horse-power and a max-imum of 12,500 horse-power, and each consisted of two compound condensing ensempound condensing en-gines, coupled to a common shaft, with an alternator mounted on the shaft be-tween them. The 44-inch treen them The 44-inch HP cylinders were placed horizontally, and the 88-inch LP cylinders wortically, the two connecting rods of each engine taking hold of a common crank pin 32 feet in diameter, weighing 185 tons, served as a fly wheel Each pair of engines weighted 720 tons. The maximum possible output of the eight scena units with which the building was fitted was 100,000 horse-power.

There has recently been installed in the same plant a magle triple-compound Westinghouse steam turbine which has a maximum output exactly equal to the maximum output of eight units, including axteen com-

pound engines, that previously fitted the engine room With the development of the steam turbine, especially in With the development of the steam surbine, sepecially in the larger sizes, the consony both in flor space and bulk and in steam consumption of the turbine, was so marked that it was only a question of time before such large reciprocating engines as those in the 74th Street power house would be replaced by the more modern prime

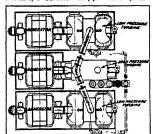

This substitution has been taking place during the past few years. Not only have the reciprocating engines of large power stations throughout the country been of large power stations throughout the country been gradually taken down and turnine units creeted in their place, but there has been a notable increase in the power of these midvidual units themselves. The first turbines to be installed at the 74th 'treet plant were of the compound type with high and low pressure elements Each of these was direct-connected to two generators, there being non generator on the high pressure and one on the low pressures shaft. The maximum output of each unit was 60,000 k w These units an aboven in the tree has remainly been completed the great turbine referred to above, which is remarkable as being the most powerful steam eaging in the world. It consists as can be seen from our photographs, of a central high pressure

be seen from our photographs, of a central high pressure

Blading one of the low-pressure retors

turbine and two outer low pressure turbines. Lach turbine is direct consaccted to its own generator. The steam is led to the high pressure element at 20% pounds pressure to the square inch. After it has passed through; it is led by a bigrasted stam pape to the low pressur.

Plan view of the triple-compound turbine

cylinders, as shown in the accompanying diagram. It enters at the center and the steam flows in opposite directions through the successive rows of blading. I rom the low pressure turbine it passes to the condensers which operate under 29 inches vacuum

The speed of rotation i 1 500 revolutions per mirror and t this speed with 20 pour is pressure at the throt tie time wonderful engine has a total loss power of about 100 000 and the total output itor three general re which it perates is 70,000 k w The generators are each rated at 20 000 km continuously and they have a maximum output of 23 700 k w for two hours I waty five cycle current at 11 000 volts is current at 11 000 voits is lelivered from the main power house to the sub-stations. The floor space covered by the big turbine is 52 by 50 feet and its height is about 20 feet. When the turbine is running at maximum load 826,000 pounds of steam pass through the blades

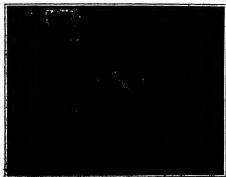

of the turbuse per hour, and the water rate is less than 11 pounds of steam per kilowatt hour

### The Effect of Great Pressure on the Electric Properties of Metals

A the great majority of the metals tosted by Bridgman increase of pressure lessened the electric resistance, antimony and hismuth being the only exceptions

According to the hypothesis of dual electric conduction the total conductivity of a metal is the sum of the conductivity due to the action of the associated electrons ductivity due to the action of the associated electrons, and that due to the action of the free electrons. It seems that increase of pressure should increase the former and decrease the latter, and as the former as probably much larger than the latter in most metals, we should expect the usual effect of mercase of pressure to be an increase of total conductivity, as it is in fact But in the case of metals for which the ratio of the two phases of conductivity is exceptionally large, as it probably is in antimony and in bismuth especially the latter we should not be surprised to find increase of pressure producing a decrease of total conductivity,

as it does
In most of the metals tested by Bridginan increase of pressure produces such an effect that heat is absorbed of pressure produces such an effect that heat is absorbed when a strain of electrons goes from the compressed to the uncompressed metal that effect being especially large in bismuth. Now this is what we should expect from what has just been said for if the fraction of the current due to free chetrons is smaller in the compressed counts due to Iric Crittons is smaller in the compressed metal than in the uncompressed nonnation must occur, with absorption of heat, at the junction where the stream of electrons passes from the compressed to the uncom-pressed metal

### The Present Status of Our Dye Industry

HFRT in America, there are many instances in which the founder of a business has lived to see the st ablishment gre w frem a one man affair to an organism tion of thousands but quite generally the process has required years and development has been at a rate fully required years and development has been at a rate may pastified by conditions with a could be arrefully studied in advance. In the dyo industry we hav an example of an entirely different way of having it do things.

In many respects and considering the conditions under

in many resisters and considering the contrensa under which it was done the work of giving America a dys industry in four years or less may be considered about the most remarkable single achievement in our industrial history. Unlike other notalise advances which have consisted in commercialising new discoveries and inventions or greatly improving upon existing products, the dye manufacturer knew the wares he was expected to supply but at the start he had insufficient raw material,

supply but at the start he had maufficent raw material, asked to hard-and sales organizations, required a plant and was seriously handrapped by the cumulative offect of a long period of skillful competitive advertising A discussion of what has been done thus far and something of the precent status as well as the possible future of our dye industry may be properly pracased with a few words regarding the complex nature of the problem and words regarding its complex active to the protein and the factors upon which (cermany seems to have counted to defeat the project of American dyes made in America by Americana Attention has been called previously to the hatory of synthotic dyes how they were first dis-covered by Pekin were siessed upon by (termany and came to be regarded as a one nation business. We have read that England might have become the home of dyes had one of her univoratios been disposed to pay a better wage to one or two instructors and had there been a better appreciation of chemical research in the islands This should serve as a warning to our own educational institutions and industries. A few of our scientists have maintained that the volume of husiness in dyes was not maintained tast we voisine in Justices in dyes was not enough to stand splitting up between several countries and on a straight dollars and cents pre-war basis they may be correct but they seem to have forgotten the relation of dyes to other industries which without them would be greatly impeded if indeed they could exist Phose include paints inks textules, leather paper for special purposes and so on

# Why Germany Thought an American Dye Industry

The factors which the Germans believed would make an American dye industry impossible included raw materials, technical organisation lack of export trade and inexperienced selling agencies. There was also a large number—between four and five thousand—of large number—between four and nive thousand—of German patents many of them product patents drawn for the sole purpose of preventing competition in America Then, there was the ever present propagation which was and is much more potent than many suppose. Now practically all those obstacles have been overcome and practically all those observed and the most resistant are gradually giving way. We soon found plenty of many kinds of raw materials and we smile when we recall the solemn assertion often made smile when we recall the solemn assortion often made that the coal tar in America is very different from that in Germany and not at all suited to the needs of the dye business A large number of plants were soon making andiline and the material often surpassed in quality any that had been imported We had always produced large quantities of napsthelene and a satisfactory grade was soon available New that the war is practically over we have a real excess of bensene toluene and xylene at hand It is true that the materials which are raws or ntermediates for the dys industry alone were very hard to get and for a time the extreme uncertainty of the future caused manufacturers to hold back. I'wo such substances are anthracene and carbasol, both used in no

substances are anthracene and carbasol, both used in no other process than dye making and necessary for alizames and rat dyes Some colors are still wanting due to a lack of carbasol of the proper purity

The United States has always done with the scaled heavy demicials so in that direction all is well. It would seem, therefore, that our supply of base materials is adequate with the possible exception of anthracese and carbasol where the question is sow that of sufficient printing. The quantity of raw material is fully adequate

# Building Up a Technical Staff

So far as the technical staff is concerned that too has been developed throughout the works. We have had

too few organic research man m our country, but the dye emergency has quickly increased the number and it has been possible to draw tigas on the chemical industries for various grades of men for the different departments of work and absoratory. The technical and research staffs of our dye plants may truthfully be said to have accomplished no four years what cernany has in nearly twenty notwithstanding the accounts in the literature to serve as quite posts. The properly qualified selfing organization has not been wanting as predicted. Many real Americans had been demonstrating and selling the imported article and they were glad to turn their talmits difficulty has been experienced inthough as doubt the proverbal deficiency of the American salesment in the knowledge of defence of the American salesment in the knowledge of Georgie languages and usstoms is somewhat of a handscap in selling dyes after department of a handscap in selling the more of merican merchandine.

While an export business is highly desirable it is not measured to maintain our dye industry which on do-

we me an export cuantess is nightly desirable it is not necessary to maintain our dye industry which on domestic business at present prices rus hes about \$100 000 000 annually it is, indeed, something to have started with so small a nucleus and within four viers to have been able to export dyes to a value exceeding that of dyes

imported in the year just preceding the war.
Another field in which we have won is that of large scale apparatus and equipment and our present position is one of security for we can I aid highly efficient apparatus for all the unit operations and can carry on most of them on a larger scale that is customary abroad Marked improvements have been made in equipment tending toward efficiencies which will stand us in good stead in world competition

### Fast Colors and Gorman Propaganda

Much has been said about prepagands and we are not yet free from its evil effects. We are still being assured that notwithstanding the retailer a efforts to use the best dyes he can guarantee no colors. In many cases if not all, it will be found that the fastness of the osses u not an at will be found that the Instress of the colors to light and washing have no we been guaranteed and that there is no justification f r the policy originals intended to make it more difficult to introduce American dyes. We now know that the large majority of the imported dyes would not withstand the tests to which our dipe are subjected any better if indeed as well as do the American compounds. One of our largest producers has prepared a large exhibit which clearly proves that point and the many who have examined the display have found ample reason to be proud of our progress and to have confidence in our dyes provi ling they are properly

have confidence in our dyes prove ling they are property used. In order to cover this last point the dye makers stand roady to assist users in the proper application of their product and at least one manufacturers offers service the control of the product and at least one manufacturers offers service the control of the product and at least one manufacturers offers service the control of the co

nees to light and washing now that there is time to work out efficient perification applied to raw materials, inter-mediates and finished dyes. The vat dyes which have been in such demiand are beginning to appear, while the maintaintense, the only colors which withstand bleeching with chlornon, are not out of the laboratory as yet. The work is progressing well, kewever, the experiment misy be carried to the sur all-factory stage nearly say time and following that there was made will be satisfied.

# A Twenty-Year Growth in Five Years

following this car of mands will be skinded.

A Twenty-Yara Growth in Pive Years

'broundy all the could not have been accomplished without adequate families and conspected specialists to operate the plates. All the sow here yet and the could not have been accomplished without adequate families and conspected specialists to operate the plates. All the saw fin pool shape. Out to their lines, improved the quality of sheft product, to their lines, improved the quality of sheft product, rebuilt their planes and man the factory oil at the case time in a dial admittedly the most complete in chemistry. Perhaps it can all be put in one sentence and made strong for those who measure thangs by a German standard, whime for the days when they may have (ierman dyes again, by aring that in some fave years our in America have done as previously, changing our country from the mapor't to the export doulma at a time whom most factors were adverse.

The present status of the dye industry is, therefore, that we have acquired the plast, the personnel and the technical experience. Proper selling and demonstrating organizations have been creased. A large amount of export business have been creased. A large amount of export business have been or the an American dye industry impossible have been overcome. Rosearch laboratories, are working out many new things and when these are ready they will be taken to the sema-commercial scale of production where the creases that normally appear when work begins on twenty-five or one hundred pound lots are worked out. It always pays to make mistakes on a small scale and successed on a larger one. While the scale of the competition of German product them-selves through the competition of German product them-selves through the competition of German product them-selves. These patents, therefore, have become a halp when the competition of German product them-selves t

Many will point to the invested capital of several Many will point to the invested capital of several hundred million and our last complete statutes and declare that the industry can care for itself In 1917 190 firms manufactured coal are formicals, 1918 concerns produced intermediates and 81 establishments emgaged in the manufacture of dyes, many making but small quantities for their own use. Now was dangers beset

# The Motor-Driven Commercial Vehicle

Conducted by MAJOR WICTOR W PAGE M. S. A. E.

This department is deviced to the intrests of prisont and prospective conners of motor trucks and eletery vagons. The editor will endeavor to answer any jet lift of mechanical festures operation in it management of commercial motor valueles.

The mobile restaurant belonging to the New York Police Department

## Travelling Restaurant for Police

THE work of the police during large relebrations is marked by actual physical discomfort because of the long riod of luty without any apportunity of receiving refreshments it is not possi ble for them to secure relief or it ave their post because all available men are uti

A feature of a recent military parade in New York was the appearance of the New Yark was the appearance of the police department a now travelling restaut rant, which per clied the paradic by over an hour and distributed sandwiches office and applies to the wounded soldiers and to police officers on duty along the street. The truck worked from 6.30 A M until late at might under the direction of a lentenant and five police. men and distributed 18 000 sandwiches The appearance of this restaurant truck was due entirely to the gentrosity if Deputy Police Commissioner John A Harriss who not only donated the refreshments but presented the truck to the police department as well Dr Harriss has always been keenly alive to the discomfort suffered by patrolmen under holiday conditions and during seven weather when their regular hours are considerably lengthened and their meals few and far between

With a view of bettering these con ditions he ordered a three-ton truck upon which chassis was mounted a complete lunch wagon—body 21 feet long and 7 feet wide I his is completely equipped as a travelling restaurant as the accompanying illustrations show having a coffice machine

meals under all conditions There ar 20 seats inside and m cold weather the interior may be heated by radiators connected with the exhaust mantfold

### New Track-Laying Tractor

NIW and self laying A NIW and self laying track type of farit tractor design 1 by C. H. Martin of Springfield Mass. is shown in the a ninying illus-tration illustrating be castase it incorporates novel features f construction
The tractor s the outcome of experimental work which the inventor did is cooperation with the Ordnance Dopartment at Washington, D C The tread is made entirely of pressed steel which means light weight and great strength and that material is also used liberally in the construction of the track supporting rollers track drive sprockets

Track-laying tractor made of pressed steel interchangeable parts

the conventional motor truck construct tion and eliminates many of the crudities usually found on this type of machine The tractor is designed to pull three plows and the design permits of ready manufacture by economical and progressive auto construction principles

r ad building This wide rim steel wheal s design d primarily for use in road con-struction because it has been found that motor trucks used in this work are ren-

Steel Wheels for Truck Conversion

CONVERTING the standard automobile truck into an efficient combina-tion road roller and motor truck has

d red more efficient when equipped with 1 rad runmed traction and supporting members which enable them to run over

One of the reer wheels

the soft ground sand, gravel, and trushed stone surfaces encountered in building roads without sinking in

roads without sinking m. The motor truck thus equipped does double duty, adding a substantial effort coward the finaled pole every time it hauls a lead of material. The constant retent with a seasy motor vehicle loaded with road building material (a five-time truck with a capacity lead weigh approximately 10 tons) sessies in firmly retent to the constant of the co trucks is built for any make of mass drive ohan, internal gasar or worm, and is essily and quickly interchangeable with ordinary motor truck wheels Truck manufacturers are offering these which sare to be used in good roads which are to be used in good roads which are to be used in good roads construction and as extra sequipment to contractors who require service of their trucks in several different lines of work. The scrompanying photographs will give a good idea of the appearance of a stan-dard truck with the new wheels attached in place of the conventional rubber tired members.

### Why War Trucks Will Not Flood the Market

MOS1 trucks used for the transporta-tion of men and materials abroad dur-ing the war will not find their way back market, reports a former member into the market, reports a former member of the 102d Engineers, recently returned from France There are two main reasons why this is so One is that the transportation problem is equally as difficult now as it was when the was reaching its oliman. The

other is that the trucks have been subjected to such hard been subjected to such hard usage that they are junk when discarded When units employing trusks are broken up and returned home all moter transports are turned over to a base or depot Those that can be repaired are overhauled and kept in service by being assigned to active units, but many trucks are serapped without even being taken to a salvage dump because their restoration is not considered worth while,

These worn-out trucks will have to be replaced by new triacks and it is doubtful (Constant on page 676)

# Good highways should be continuous!

We should have continuous highways available the year 'round

Traffic should continue to operate in winter as well as in summer

Economic development demands this

Mr Roy O Chapin, Chairman of the Highways Transport Committee, says

These main highways must be brought into a comprehensive system—patterned as the rail roads have patterned their systems string to connect population and shipping centers with regions of natural resources—agricultural mineral, etc. Permanent surfaced highways must be built and maintained sufficient to with stand the strain, and carry the traffic of the future."

Of what use to National highways transportation are certain good sections of road, if some communities persist in their neglect to improve and properly maintain the connecting links?

The facilities for motor car and truck transportation are already far ahead of the roads This neglect of road improve ment, therefore, is putting obstacles in the path of rapid national economic develop

The one economical method of making and maintaining highways is Tarvia macadam construction

Plain water-bound macadam is no longer strong enough for heavy traffic highways but Tarvia-macadam will stand the wear and tear of speeding automobiles and giant motor trucks

The initial cost of a laivia road is a little more than that of ordinary water bound macadam but the great saving on maintenance more than offsets the difference in first cost. Indeed many communities are now using Tarvia on all their principal toads to save money.

Communities that already have plain mknadam roads that are beginning to show wear will find that a prompt surface application of the appropriate grade of farvia will aircst their deterioration and greatly prolong their life, and at much less expense than by any other method

# Recently Patented Inventions

Brief Descriptions of Recently Potented Mechanical and Electrical Dusties, Tuels, Form Implements, Etc.

INCLINOMETER FOR AIRPIANES—G W FARTHING 537 latton at Dry Fork Va Among the objects of this invention is to provide an in linometer adapted to be mounted in th hood or cowl of an airpia of the inclinemeter in luding a plumb ring pivotally mounted and adapted to always remain stationary the and support of always trained successive to it fix the bottered by the plumi-cing and a corresponding pointer back of the ing indicating the amount of lateral deviation fitts planes from the horizontal

# DODGE

# The New Keystone Steel Pulley

The grooveless, evel erows of Keyetene Seel Pulleys presents a smooth, uninterrupted surface to which belt searchly conforms. The Keyetone,

Keystone rivets never sheer. Whenever rivets are used in Keystone Seel Pulleys, the metals are countersumb. This protests the rivets from all shearing strain.

The cond-soil had of Majoraba Pallinys has interception. These contents in horselessy or this point on the copies out on layout total rise to half. The common of the high in South Stars in those at those on market on Majoraba to Thompson before are analyTHIS new steel pulley was born of wide experience in steel pulley design and manufacture, and proved by actual service under the most strenuous operating conditions. It will make good for you.

Here are a few special features that insure its long life and low operating cost:

The Rim—Made from steel 3-16° or 1-4° thick, so solid and substantial that it needs no beads. Rim Edges faced in a lathe to insure balance and true running. The face is a grooveless oval which affords 100% effective belt contact (See illustration at left).

The Arms—Extra strong and wind cutting, offer minimum air resistance.

The Hub—Interwoven with the arms affording the greatest possible strength. All sizes over 16" diameter reinforced by malleable iron yokes. The new Keystone, when properly tightened, will not slip on the shaft.

Rivets protected from shearing strain—wherever shearing strain could occur on Keystone rivets the metals are countersunk. This positively prevents sheared rivets.

This new steel pulley has all the advantages of other steel pulleys—and a few of its own.

Order one from your dealer. We'll guarantee it.

A magneto creates its own electric current—it does not rely upon an uncertain source of current for its dependability—

It doesn't have to feed six lamps and a gourmandizing starting motor—

It is a self-contained, responsible, simple mechanism that specializes on just one thing—creating current for ignition.

Be sure your new car is equipped with a SPLITDORF Magneto. Then, whether you forget to nurse the overworked battery or not, you will always be able to get dependable ignition performance for the engine.

### The Friendly War After the Wer (Continued from pass 652)

and etherwise acting as orthodox advertis-ing agent. It is worth noting, by the way, that those in whose hands has been placed the actual workings of the Industrial Publictty Service were selected with unusual care. They are all men of big caliber and

are paid in proportion

The supreme importance of an adequate foreign press service as viewed by the Federation, is set forth in a report sub mitted by its Overseas Main Committee

other things, the report states
'Your Committee urge that propa-'Your Committee urge that propa-gands and publicity matter are of special urgency at the present juncture for the following reasons '(1) The closing down of the British Ministry of Information at a time when the

governments of other countries allied and neutral, have embarked on an intensified propagands in overseas markets
(2) The great activity of foreign and

olicity agents
(3) The general lack of intelligent or

adequate propagands on behalf of British industry and commerce in the press of foreign markets even when that press is substantially or mainly supported by revenue from the advertisements of British

The man retained to control the foreign press propaganda is peculiarly well fitted for his task, having been for many yoars at the head of one of the largest advertising agencies in Great Britain. His stuff is agencies in Great Britain. His staff is being actively recruited and the preparation of live news matter is at present in

It is felt by the Perioration that eventually the funds accruing from the Publicity Service in its capacity as advertising agent will amply maintain its press service and that these funds are more likely to increase than to diminish with the passing of the

Viewed by and large in confining its definite action mainly to the sphere of publicity in its various forms the I eder ation seems to have taken the only cour that is both practical and impartial Di-rectly to subsidize, or in any other way to foster the interests of any one industry or group of industries could not ride ind to the advantage of British industry as a

whole it is quite clear that the Federation the most powerful trade organization Cruat the Britain has even known is prepared to fight is Britain has even known is prepared to fight is 111 and her debt is 3.50 per capita would be considered to was have been anticipated and success ceases have been antempated and success [121] with a debt per capits of 3600 Association of Manufacturers in other cases the chief departure from precedent us in the comprehensiveness and thorough-which (when the comprehensiveness and thorough-which (wirmsp) will have to pay and which the most of the measures taken a X apy rate in turn will lighten the burdens of the other capits. Association of Manufacturors in other cases the chird departure from precedent is in the comprehensiveness and their other is manufacturers, who are not accustomed to shrink from competition unless it be fostered by government subsidy or be otherwise unfair need and heattate to take up the gamder. It is sometimed to the competition of nance in the world's work and that the western hemisphere will earn its full share of the fruits of this work

# Monetary Cost of the War

in New York, which race 284 feet from the

Standing beside this tower of debt hive shown a block of gold measuring 43 8 feet on a side which represents 20 billion dellars or an estimated total of the supply of gold in the world (if course the real significance of a debt is not measured by its total but by the per capita burden and its relation to the meomi per capita of the nation. For this reason we have shown a conventional figure representing a citizen in each of the five countries involved. The wealth of the chirted states is estimated at 300 billion dollars and dividing this among a population of 107 million we have a per capita wealth of \$2.803 The debt of 30 billion dollars divided among the same population represents a burden of \$280 on each individual and so the conventional figure of the American estisen is sh with a bucket which if full would hold \$2 803 but which has been emptied to the extent of \$280 while in the bottom of the bucket there is a leak from which is drip ping \$11.68 representing the per capite interest on our national debt

Great Britain is somewhat in the same condition as the United States in the fact that a certain portion of her debt, about billion dollars, will be paid back by her allies and dominions so that eventually her debt of 36 billion dollars should be reduced to 31 billion dollars but as this has not yet been repaid we have retained the total debt of 36 billion dollars in our the new control of the per capita indebtedness. The per capita wealth of Great Britain is \$2.600 and her debt per capita \$782 and the interest on the dubt per capita comes to \$34 24

France with the same dobt as that of Great Britain has a much bigger load to carry because her wealth is not so great and her population is smaller. In estimating the weather of France the calculation is complicated because France suffered heavy losses of property in the war. On the other hand Alsace-Lorraine has been added to I rance and the wealth and income of these provinces must enter inte the calculation Taking all these factors into consideration, the national wealth of France is placed at 90 billion dollars so that her per capita wealth is estimated at \$2.250 with a per capita debt of \$900 and with interest on the debt of \$45. The burden of France therefore is exceed

nations

The situation is tabulated by Mr Fish as follows, the figures for United States having been amended by us as explained

| Inited States<br>Freat Britain<br>France<br>taly<br>Jermany                                                                                                                             |                                                             | 880<br>86<br>85<br>13 6 | 90 | 10<br>80<br>40<br>31     | 8 | 1 8                                  | 001 1      | 5 6<br>5 0<br>7 8 | 10                               | 88888 |      |

"IT IS LESS COSTLY TO BUY A GOOD BELT THAN TO SUFFER FROM A BAD ONE"

Our process of making hides into leather belting depends as fully on hand skill and experienced judgment as on machine work. This personal element in manufacture is what gives our belting its better quality. From tanning to inspection, the watchfulness and care of our workmen never stops. This accounts for the unusual wear and service of

Iewell Belts are always tough, strong and pliable. They grasp power grimly, and deliver it with a will.

Whatever your belting needs, there's a Jewell Belt to suit them. Jewell experts will aid yours in picking just the right belt for your purpose.

You will always find one of these Wrench Sets most convenient And if you should meet with an accident miles away from anywhere, when you are in a hurry to reach your destination before dark, think what it would mean to have just the right tools to work

Their cost is negligible but there are times when would give anything to have them. Why not add you would give anything to have them Why not add a Wrench Set to your equipment and be prepared for emergencies?

The reputation of Williams Superior Quality is your guarantee of absolute dependability

> H rite for our booklet of Superior Wrench Sets, showing assortments of styles and sizes for every purpose

inaccurate One cannot match up exactly two lnes, however fine they may be, and however nearly the same thickness. There is bound to be some error, which may be as much as 40 merons (one meron equals 1/25,460 meh)

The Hoke system substitutes end measurement for this line measurement. This surement for this line measurement. This is inhereatly more accurate, two bars, wring to a someon base, can be compared for length, susskanically, with an accuracy that goes far beyond this figure. So if interference neethods, with an abstracy that goes far beyond this figure. So if his investion leads to the general replacement of the line measurement by the end measurement, in connection with lengths and thicknesses, Major Hoke will be well pleased. ploseed

# The Propent Status of Our Dye Industry

(Continued from page 860)

war must necessarily have a great influence of manufacturing for peace purposes 50 that while it is true that much otderwise measurement from peace 800 that while it is true that much otderwise measurement will be more and the government was recomment with the more peace and the proposed of the more peace and the more and the work. The dye men have said the war it is also true that the knowledge thus gamed and either now or eventually in he made public will be of the greatest benefit not only to the United States, but the world at large

The American Precision Block (Continued from peace 818) what amounted to a challenge it was increasing four to develop some measure of more reput and far more measurements and the method of the interferometer, which deals with millionath of an inch, but certainty far more rapid and far more nearly self-out this demand will be the solice of another contrained will be another that the measuring distinction. The solice is another than the measurement of the solice of the

# Idle trucks are costly

THE earning power of your truck depends on its ability to render uninterrupted service. Cheap trucks are too often out of commission and for too long a time. And then they don't last.

An economical truck cannot spend time in the repair shop. It must be working and earning its keep. Our records covering 103 lines of business in which we have installed trucks proves conclusively that a

been and that the money invested in dye
research in Germany has been the best
investment in the world's history. It is
the second time colors have helped make
a nation strong. The first instance in
histry goes back to the days of Tyre and
(arthage when those walled cities owed
discovered to the control of Tyrean nursies. (arthage when those walled titles owed their wealth and power to Tynan purple, a dy, stuff obtained from a small snall-like shell fish the identity of which has been established from the piles of shells remain-ing. The dye stuff itself has been dupliing The dys stuff itself has been dupli-cated synthetically and is a form of di-brom medge inferior to that now made so successfully in Michigan A dye industry will also attengthen us but it is not full grown and nood our support. A foregared being saked for his with the considered America agreement with the considered America agreement successfully and the con-takt the will for the deed Knowing that we have the resources and ability to actake the will for the deed innowing that we have the resources and ability to accomplish something we have decided to i we are a little inclined forthwith to call i we are a little inclined fortunit to call it done. There is that danger in the dye situation and while its present status is surely satisfactory and highly encouraging their remains much that the public itself

# 1 1st do if we are to make it strong enough Why War Trucks Will Not Flood the Market

(Continued from page 862)

if the number of trucks now contracted for will be sufficient to take care of present needs the railroad system of France even including the temporary military railways was and still is hopelessly in al quate and motor transports were verladed and driven at excessive rates f at ed over roads that had been worn

r uned by bombardment

The command of hostilities has not 1h coestion of boathities has not riv li transportation difficulties Troops rust be fed and elothed, and the large movements of troops still taking place in France add to rather than leasen the demand for transportation. The feding of the Central Empires and new states also adds gratly to the burden of transportation for they as well as the Milke are short of transportation. How the return of the refugees to the invastation reconst where railroads have

icvastated regions where railroads have en distroyed and nearly all roads have ten bedly damaged by shell fire, requires an enormous amount of motor transporta-tion These people require supplies of all kinds in addition to clothing and

food with which to rebuild or restore their ruined property I actories stores homes and even farms must be rebuilt and until the entire war ruined area is restored there will be but little lessening of the tramendous demand for trucks, and the severe work performed during the restoration period will surely cause such depreciation that trucks that were in good condition at the close of hostilities will be of little value when the first rush of the reconstruction period is over. In fact, there will be a large market for new trucks to replace those worn out in such

### The New Zmoonium Steel

Sibbl containing screenium promises to play an important role in the future metallurgy of the steel industry, says is demic (wil Here again the war has been Genic (but here again the war has been the immediate cause of the development of the use of this element. Mystery, at least so far as published data are concerned, surrounds the results that have been attained in the United States from putting successive improvaments of weapons and arrownium into various steels. There have tools of stone, bose, horn, lovery and wood, been rumors in circulation about the strik- until the final retirect of the top probable that nothing Christ Inspite of the remarkable progress very definite than here ascertised up to which he make during what we call the their the transition was signed. The Paincollithic Age, it is evident that other ascertised up to which he make during what we call the their difficulty had evidently been, and general progress had been restarded as call is, the production of a uniform terro-

simmaken, one containing definite measures of the sectal and correspondingly regular simousts of other may represent or the stemace of the sectal and correspondingly regular simousts of other may represent the sectal section of the section of

be credited with bestowing the unusual properties we are not told. The value of both manganese and silicon is already ap-preciated. It is a high manganese content precisted It as high manganese content shore that has made possible the produc-tion of cast steel chain in this country having properties superior to say chain heretofore made It is probable, however, that in the same manner that vanadium makes steel santi-fatigue, so sirconnum increases to a remarkable degree the tough-

Considerable concern is reported to Considerable consern is reported to exist as to the future supply of vanadum it is and that present resources are being rapidly exhausted and that it may be necessary to find a substitute for vanadum it is shoped that this may not be necessary for the value of vanadum has been emmonity demonstrated 8 bould the rumors turn out to be true, it may develop that other substitutions of the contraction of the contra that either sirconium or even titanium may take vanadium s place to a greater or may take vanasum s pases to a grosses or less degree Already the interest in titanium as an alloy in steel has been so active that unusual results are heard of as to its value as an alloy in steels

to its value as an alloy in steels It seems certain that we are on the eve of most interesting developments in the real mof alloy steals containing the rare metals. It is probable that the interesting results obtaining by the British in the evolution of their tank armor should be credited to steels containing sirronium, molybdenum and perhaps vanadium and the steels.

### Ornament in Old Prints and Drawings By William M. Ivins Jr

IN the Exhibition of Ornament m the cum of Art there are to be seen a number of most interesting examples of the manner i most interesting examples of the manner i which the craftsmen of past times utilised the pattern engravings made by the oli masters of design. Few of these designs masters of design. Few of these designs show any particular care upon the part of the designer in regard to such matters as perspective or true proportions and an even smaller number of them are measured or working drawings but the craftemen i evortheless knew how to translate them into the terms of the particular thing they were making such as the same tune may be interpreted by the verte or by many instruments. As an instance of this, may be taken the series of plates by such great artists as Raneon and Lalonde showing wrights and binches of fi wors and ribbons. combined in the most charming and beau commed in it most charming and beau tiful designs the engravings so delicate in line that to the casual glance they seem far bitter fitted for title pages or book plates or ever if rectales than for execution in any of the heavier in storials in which the interior decorator wirks. But over two of these fragile and dainty examples of the engravers art there are hung in the Mus-tum galleries great panels of heavy wood upon which the designs have been carved out as wall de oratios one in paint and the other in carved oak. The carved panel is particularly enlightening when comis particularly enigntening woon oon-par d with the tagraing because few woods are heavier or o'arser in grain than oak as 1 yet it has been used to perfection as the medium in whi it the peculiarly light and graceful lines of the otching should be given permanence Throughout the panel the design has been given more swing and its elements thrust a little wider apart than in the print so that its heavier lines could get the san e amount of free play Just as the engraving is a masterpiece of refinement and minuteness so is the carving one of the most beautiful among the many beautiful pieces of carved wood in the great Morgan Collection It would be difficult to find a more perfect example master craftsmen of old France utilized the wealth of design that the artists and draughtsmen prod tot d for their benefit

draughtsmen produced for their benefit in a case in the middle of the opposite wall of the same gallery are shown ormoly mounts for furniture among which is a series of swags and garlands which obviously were napired by these same damily etchings of flowers—the metal craftsman working his bronne se casily and surely as the painter or wood carver manipulated his own materials.

In the mallery contanuag the earlier works there is a splends thoroug of Reasinance design of this same abstract nature A single fram for instance, contains a reproduction of a print by Aldergrey: the original of which is in a neighboring frame and beside it reduced to the same scale pholographic reproductions of a sarved stone pauel a giased and colored store till and a bear my all bearing the

workers which are accompanied in each case by a piece of lace or drawnwork or embroidery often made slavishly from the httle black and white woodcut design, and in other instances showing how the needleworker varied or simplified the pattern set for her by the woodcutter Many of these needlework designs were also utilized in their time by wood mlay or interess work ers and by wood and stone carvers in the laying out of work intended for panels and fricks in rooms and on large pieces of furniture and by mlayers and metal workers for borders around small boxes and

other suitable objects
I articularly important is the series of designs for cups and goblets in fine metal and dystal for in them can be seen the same elements utilized in embroidery, in of su h things in the great days of the Renaissance | there are a large number of most surprising flower and leaf designs which found their way into the hands of talestry makers, silversmiths, and the men who carved crockets and ends of chair man who carved crockets and ends of chair haidles Rarely if ever before in this country has there been an exhibition con-taining more beautiful and exquisite de-signs than this one at the Metropolitan Museum of Art and certainly there has never been one like this in which the multifari us uses to which designs of the greatest masters were put in practice have been allustrated by actual juxtaposition of de-sign and related work of the craftsman 1c the designers and craftsman of today le the designers and cratismen or women three-chibition offers an opportunity such as his never before been given them to see it ctual way in which their predecessors as all dithemselves of the wonderful maternal () be found in old books and prints and how they turned that wealth of design to are in a sureed that wealth of design to their (win purposes, especially to the long-headed business man, be he producer or distributer, who is able to gage the direc-tion of industrial art development in this grad compressions and abstract great country, such an exhibition is a source h information and an index of un limit I possibilities for the improvement of current products. Design has always been a selling factor, for design is bound to remain in all types of home furnishings and other industrial art objects the primary factor of musity. factor of quality

### Airplane Researches of Value in Other Fields

THI war has placed an opportunity in the hands of furniture and penel manu-latures to benefit by the increased kn whedge of the premiarative and char-acteristics of wood and glue

Under the stress of war and the necessity of furnishing aircraft to the fighting front in large numbers and a short time, it was found necessary to supplement the infermation available on wood and glue by extensive additional research work on these two important construction mat It was found in many instances that face teres taking government contracts for aircraft and wagon work had in their desire to help neglected to go into the situation thoroughly and found themselves unable to produce on schedule The rigid governproduce on schedule. The rigid govern-ment inspection showed them that their equipment was inadequate to meet the special demands placed upon it, and their knowledge of the peculiarities of the ma-

to be used in the hot, analy sections re- A series of tests made at the keyst and the series of tests made at the keyst and the series of tests made at the keyst and the series of tests and the seri the mere gluing of laminations and shaping square inch the block—internal stresses occurred that any to we caused warping and open joints in seems saved suit as

same design as that contained in the little print As microsting as anything in the whole schibithm are the two large floor cases between high grade laminated work containing rare old patterns for textile the class of work of carried with the containing rare old patterns for textile the class of work ordinarily accepted commercial standard. It is not su craft plywood for the various governme

aircraft speerfication arrorant specifications.

While waterproof gives have been in existence for some years, they were not well known and lattle information was at well known and httls information was at hand as to the correct procedure for their successful use. During the war the Forest Products Laboratory of the U S Forest Service at Madison, Wis, has been working on problems that seemed to give trouble to the plants engaged on war contrasts. Much help has been given manufacturers and a large staff of specialists has been ea-gaged in obtaining information and develop-ing new ideas in the uses of glues and wood

It must not be inferred that absolute phases of the uses of woods, and that the laboratory will be at once a panacea for all though much has been learned there is still much to be done It is merely pointed out that the Government mainte under jurisdiction of the Forest Service tution equipped to handle many of the difficult problems continually arisis in the manufacture of furniture and panel me continually arising

### "Pertinax" as a Substitute for Mica and Other Things

THE compressed paper product, called "Pertinax" is a useful substitute for mica for electrical purposes, according to a report in a German paper The parmes for electrical purposes, according to a report in a German paper. The par-ticularly high insulating qualities of mica are connected with its peculiar structure in layers, and this structure has been suc-successfully imitated in "Persinax." The material is particularly able to withstand pressure (for instance, in the shape of tubes, it is far superior to lead tubes as regards its resistance to internal pressure), and it can easily be worked similarly to wood, that is to say, it can be to stamped, and drilled "Pertinax" stamped, and drilled "Pertinax" ap-proaches mice very closely in its electrical properties. Its puncture voltage is about 25,000 volts. The material is not affected. properties Its pluncture voltage is about 25,000 volts. The maternal is not affected by hot oils, and only begins to be destroyed at 200 degrees centigrade. The tensile strength is 8 85 tons square inches, and is therefore, nearly as high as that of the best

The word is counsed from the Latin pipes are made by impregnating shee paper with synthetic resin, and rolling them around a mandrel of the desired dimensions until the proper thickness is secured Heat and pressure are maintained mean-while until a hard product is obtained While that a hard product is obtained Formerly natural resuns were used, but the introduction of the synthetic variety has raised the temperature of softening to above 180 degrees centigrade

above 180 degrees omtigrade
Difference of opinion seems to exist as
to the effects of water upon the material
Though one writer claims that it i insoluble and water-proof, another states
"Their aborition of water makes their
use madvisable for that liquid, but thay
gave excellent results when used to carry
oil, a fact which is explained by the wellknown resistance of synthetic resins to
othe" There is no record of their being
used successfully for water pipes, though
they were practical for carrying gas and
oil

snowings of the peculiarities of the me-terial was not sufficiently exact.

# The First Pneumatic Truck Tire Built

# SCIENTIFIC AMERICAN Between in second class quarter from 18, 1879, at the post office as New York, E. Y., under the Ass of March 2, 1879. 4 AURI 1919

THE bulk of the world's mechanical power comes from four sources—steam, water, electricity and gas.

Power efficiency depends upon lubricating efficiency. For over half a century the Vacuum Oil Company has specialized upon this great problem.

Today this Company is looked to for correct lubrication by operators of every known kind of power machinery.

Gargoyle Lubricants are known the world over. The red Gargoyle on cans and barrels points the way to higher mechanical efficiency and lower operating costs.

# Lubricants

So he demands a Billings & Spencer Triangle B wrench because his own reputation makes him value theirs

You can safely take a work man's word for what is right in tools.

He will tell you the Irrangle B wrench fits his hand as if it were glad to work with him \_its steel is tough (not brittle) with a hidden some thing in its makeup which means honest years of service instead of dishonest months of trouble

That hidden something took

several thousand men fifty years to make It is the value behind the Triangle B trade mark On a tool, a drop forging or a great machine, it says Rely on me," and it has said that to the world of industry since the days of the Civil War

Remember the last time you worked over a difficult nut' Did your wrench slip just a little and makethe hard jobharder 'Triangle B wrenches would have helped in stead of hindering-they fit those hard to get at nuts cleanly, surely without a slip

Your hardware dealer or your garage accessory man will approve your judgment when you say Triangle B or Billings & Spencer.

He likes to sell satisfaction!

Draft 8 feet 2 inches Dispiscement 1 000 t.m. Oil find capacity 228 tons Moutre power Horse power 26 000 Speed on trial fully equipped with find for 1 000 miles 39 6 knots per "Turqueber", which holds the world s official record of 39 6 knots for four hours Motive power twin turbines direct connected Revolutions

# Developing the High Speed Destroyer

THE following story concerns the last six years of destroyer construction in the British Navy, and in the beginnings if takes us book to the days of McMckens, who, as First Lord of the Admiralty, had built 60 destroyers of Admiralty design when were termed "374coot boats" The speed of these cross-termed "374coot boats" The speed of these cross-termed "374coot boats". termed "27-knot boats" The speed of these craft wrand from 27 to 29 knots. One of the best known builders of destroyers had urged the Admiraty to discontinue this class of construction, as being too slow to compete with the destroyers that were bump built by the Germans, which had a speed of 30 knots. It was urged beat to the destroyers that were bump built by the Germans, which had so speed of 30 knots. It was urged beat to the Germans of the transpect of the Knots of the Germans of the transpect of the Knots of the Germans of the transpect of the Knots of the Germans of the transpect of the Knots of the Germans 
operations All of them a heved phenomenally high speeds. The record for the class and indeed the speed record for all destroyers, so far as our information goes was made recently by the "lurquoise on what is known as the Skelmorite Mile which is at the mouth of the Lyde Here, on her official trials site attained a mean speed of knots on a four hours continuous run

It should here be remarked that the Skelmorhe Mile is selected by the Admiralty as the most reliable measured is selected by the Admiralty as the most reliable measured use for trails of fast vessels he kause there is a depth of water of 240 feet which is the least depth upon which trails can be made with a reliable result at the high peceds now prevading with destriyers for it has become known, and is now fully recognized that higher speeds can be obtained in very shallow water than in very deep water, for this reason no trails are now made by the Admiralty at the mouth of the Thames I he effect of very shallow water steep give a false mercase of speed to destroying, which in former days was never supported. Another Ranous destroyer of this type in the

Mounsey which vessel not only attained the excep-tional speed of 39 knots on her offerill trial but while

tional speed of 39 knots on her offeril trial but while on active service was the means of recump objectorous from the Crusser Ottanto during a gale of wind The Turqueous is fitted with 16 transverse bulk heads dividing the hull into 16 man compartments, which are further and divided by the watertight and odlight decks. The petty officers and crows quarters are forward of the machinary space and the commissioned officers quarkers are aff. The vintulation of the crew spaces forward is by means of a fan and system of distributing trunks thus avoiding the necessity of cowls on the forecastle deck which are a source of trouble in had wenther

The gun armament consists of three 4 meh quick-firing guns one on the forecastic one amidships between the funnels and one aft also an ante aircraft gun. The torpedo armament consists of two sets of twin 21 meh torpedo tubes with four torpedous

he propelling machinery consists of two Brown Curts turbines coupled direct to the main shafts and capable of developing about 26 000 horse power. In bodons are arranged for burning oil fuel and the oil fuel capacity is 228 tons

We have been favored with the official

We have been favored with the official data of the acceptance full speed trial of the Iurquoise which took place March 14th of this var I lint was no wind and the sea was sureed in the best ax miles this speed as were successively 40 74 3913 and the sea was sureed in the best ax miles the mean speed for the whole forces and the mean speed for the whole forces and the sureed as the bollers was 262 78 pounds, at the engine-room 231 pounds, and at the engine-room 231 pounds, and at the the engine-room 231 poonds, and at it is nozzle-chest 213 5 pounds. The mean su perheat througout the four hours was 95° resembled to the control of the con perneat throughout the four nours was 95°.

F vacuum 27.75 and mean revolutions,
711 The propellers are three-bladed 7.ft
11 ins in diameter. It is probable that 35°
knots contract speed will be 41° futur
unnimum. War service has sh wa that destroyers can be built to stand herd usage.

### Laurch in America-Breakfast in Europe

EARCH through the history of all the arts and sciences and you will find none that has furnished so much of the sensational and the heroic as the test of them all the art of flying—that amazing child of the Twentieth Century Scarcely have we caught our breath at the announcement that a seabird-a boat which had taken unto itself wings-had flown from America to Lurope by way of the Ascres and the Spanish Main than the message comes that a land bird scorning its native element had swept across the Atlantic from Newfoundland to the Irish Coast in one wild flight of sixteen hours and a half

It should be noted that for both of these performances we are indebted to the exigencies of the great war The NC-4 which Commander Reid piloted so ably was built to fly to Europe and there engage in submarine The Vickers Vimy bomber which carried Centein Alcock on his amasing dealt was built to bomb Berlin In both cases practically all that was necessary was to substitute an equivalent load of extra il fuel for the load of bembs and the machines were ready for their etime venture Nor should we f rget that engines of the necessary reliability and power for transatiantic flight are also a legacy of the war The Liberty motor was not conceived until we were c minitted to the great struggle and it is entirely a chill of the war Royce mot r had won great distincts n it is true long before the war started but it was built only of the moderate horse-power required for automobile service The 850-horse-power engines of the Vickers-Vimy machine are a war product

The outstanding facts of the non st p flight of last Sunday night are the astorishing speed of about 120 miles an hour and the unerring pre ision with which Lieutenant Brown the navigator 1 ld his way over the course of 1950 miles The speed and distance are the given in the cabled dispat hes the exact figures will be known when the log times f start and at ; etc have been analyzed and rep rted up n by the Royal Air Force to which b th Al k and Brown b long

Full particulars of the machine were given in our last issue Its weight as tleft the gr ind is stated to have The fuel supply was 871 gall ns or suffi cient for 25 hours at a cruising speed of 90 miles per hour The meteorological conditions were g d A westerly wind of 30 miles per hour was blowing at Newfoundland and southwesterly to northwesterly winds were predieted across the Atlantic for the next twenty four hours Except that a drift indicator was carried the navigator relied upon the sextant chronemeter and compass According to cabled reports the trip because of fog rain and si et was a very hard one and only three observations tw of the stars and one of the sun wer possible m reover but little use could be made of the draft indicat r Ti e p : r visibility makes all the more wonderful the unerring course which was followed for the landing was I ade within a few miles of the place selected by N vigator Brown The machine left St Johns Newfou iland shortly after four (Greenwich time) on the aft r on of June 14th and landed next morning between nine and ten o clock, near the wireless

station Clifden, Ireland. So these gallant lads, who had lumshed in America, had

their breakfast next day in Europe.

Captam Alcock completed the flight with one-third

of his fuel remaining in the tanks, sufficient for another eight hours of flying. He nursed his engines excefully keeping them notohed down for a speed of 90 miles per hour. The difference between this and his speed over the water is 30 miles so the predicted westerly winds must have prevailed throughout the trip and their aver-age velocity spust have been about 30 miles. If the 30its wind had been against him and he had elected to run at the same crusing speed of 90 miles his time would have been 24 hours and his fuel supply would have just sufficed to put him across

### We Should Hasten Battle-Cruisers Construction

F all the ships of the three-year program the six battle-cruisers should receive the first attantion We have not one of this important class of ship in our navy today This is due to the exigencies of the war There was a call for destroyers, and we built them In this we gain some compet for in vessels of this type built and building we rank close to Great Britain, who is making an extensive sale of her slower craft and we have a much stronger destroyer fleet than Japan or any Continental power But the absence of battle-crusers leaves a serious gap in our fighting line and these ships should be given preference over any other type in the matter of appropristions and facilities

Unless some other naval power should bring out a new design these ships when they go into commission, will be the most powerful and fastest of their type affect With the exception of the new British composite ship

Hood they will be the longost ships in any navy with an overall length of 872 feet. The nly vessels with which they can be compared are the British Renown and Repulse drawings of which we published last week These are just under 800 feet long But in gun-power and speed ours are greatly superior for our ships will carry eight 50-caliber 16-inch gins as against six 42-caliber 15-inch and their speed if expectations are realized will be 35 knots as against 11 to 32 knots side armor was to have been 5 inches but now that all the bulers are below deck the arm r that was assigned to the upper boilers will be available as extra protection on side or deck

The sinking of the three British battle-orusers at Jutland due to shell flash reaching the magazines em phasizes the importance of giving spe ial protection in the way of and above the magazines It is true that two of the ships had open or indifferently closed ammuna-tion hoists—something that we attended to years ago But in all lightly armored ships in these days of heavy long range shell fire it cannot be denied that the magsines are the danger point

Therefore we again suggest that it might be well to consider whether a drop of the speel to 33 r 33 5 knots would not release sufficient boiler and engine weight to thicken the deck protection al ve the magazines I ut ire shell fire will be controlle ily radio from unheard of ranges and the angle of full will be steep. Already guns are afloat that fire a 3 000-po ind shell. It will take careful planning and the I beral use of horisontal armor to prevent the flash of such a shell from reaching the magazines

# Spruce Up!

CERTAIN canny con tryman found that hm A house needed a coat f paint and a fresh layer of shingles over the porch On the basis of house needed a coaf f paint and a fresh layer his old bills for similar work he fixed on \$400 as a fair price but when he called in the local contractor, he discovered it would cost him \$500. So he put his foot down and said he would wait for prices to come back to the usual level

A year or so later sure enough prices did come down But when the canny one again jut in motion the matter of repairs he found that the xtra year of unpainted nakedness had caused his clay boarding to deteriorate to such an extent and that the bad shingles had allowed so much water to go through t the underpinning of the porch roof that to put his house in order at the low prices of the day would cost \$600 He is still seking hims how much be made by waiting for prices to drop,

In another one, the first chapter of title instead of the fortuner was deplicated. But have prious never fill down; and the thefity gentlemen finds kinned for the position of the near who enver that he revised near have he had required the position of the near who envers that he revised Rendelect.

In still another community, it was the willage heeper who wated to have necessary making effected on his house and his garage and his automobile and other property And because of his influence in town-meeting, he renovation of the schoolhouse and the building of badly needed new bridge and the rescastruction of several badly washed-out places in the roads were stocked by the core wasting the drop in prices. The consequence was that the local expenter was unable to meet his interest and was put out of business; four residents who had work horses but no work for them residents who had work horeas but no work for thus, reated them, for the season in another town, the find dealer moved to the city because of this loss of tends; the best part of the surply of dany produces was out off when a hig producer had to this to the next village, further away but with bester roads; and the gazerd prosperity of the home town got a kink from which is never re-

The application of the above parables may not be obvious but it is none the lass direct. During the period of the war we concentrated all offorts in work of wartime value, and out off labor and supplies indiscriminately from other lines. Prices of everything went up nse of increased demand and reduced supply ar at the same time the machinery of daily life was getting more and more out of order, more and more down at the beal, more and more in need of extensive renair and metruntion

Now the pressure is relieved, not se much as regardenes, but certainly as regards the propriety of us labor and materials for whatever purpose we will It is true that as yet we do not know what will eventually happen to prices—whether they will stay where they are or go up or fall off. But in any case the amount of repairs that each one of us owes it to himself to make is not large and could easily be afforded if we but thought

If every one of us by going shead with whatever work he has to do will contribute his mite to the general amployment and the general business welfare all will go mmingly and the country will regain its normal keel without mishap But if any large number of us attempts to play the part of the canny fellow who waits for prices to go down we are going to get left in precisely the way that the heroes of the above parables got left. The eretary of War realising all this has inaugurated a Spruce-Up Campaign urging everybody to help the return of normal business conditions by doing the little things that have gone undone for the past two years

Everybody should be aboard this band-wagon there is no scouse for a surgic absented

# Waste Paper Mill Bark as a Source of Tanning

THE feasibility of using waste hemicok bark from paper mill operations for tanning purposes has been further demonstrated in recent tests made by the Forest Products Laboratory Results obtained first in an experimental way were so encouraging that the investiga-tion was finally carried out on a semi-commercial scale in cooperation with a paper mill, a takenery, and a manu-

in cooperation with a paper smill, a businery, and a manu-facturer of drying equipment. It is found that no growt technical difficulties stand in the way of utilizing paper-smill bank for such purposes. The product is satisfactory from the teamer's standpoint, and it can be prepared at a cost which will allow in the computer with last bank.

see or use of paper still back for teamin would insee a source of income for the paper still from a susjently which is now of little or no value. If would also, he is dividend on a susjently which is now of little or no value. If would also, he jake interned in a suspense problems of elevants published. The tanner would be assessed of a orinitial tappy; and stick their which would allowed him to heap made in an assertable in adjustment of the dispersal in a size of the size in the dispersal in a size of the size of t

# Newly Discovered Pre-Cambrian Sea When in Earth's First Creatures Were norm

THE Smiths i an Institution Washington announced the discovery by Dr Charles D Walcott of several the useful fossels in the canadian Rockies, of animal first much more highly regained than those which he lad fund privousely. Annually in summer he has taken out an expeditum to this region, devoted injuvely to collecting fossils from the formations known as the cambrian rocks. He was the first to find many firms believe the Selbrans was a Bertofore, he had found sthing below the (ambrian period and all of the latest o mining perow the Cambrian period and all of the latest cy dutionary books of 1918 commen c the period of first similar without backbones with this stage of earths history. His new find upsets all previous discoveries and history. His new find upsets all previous discoveries and calculations including his own in that he has uncerthed wonderful animals in fossil form for helow the Cambrian. only one-celled Amoeba etc existed In other words in the geologic age in which we had supposed there was merely uncellular animal and vegetable his evolving merely unrellular animal and vegetable nie everying actual swimming and crawling water forms of atimals were already dominant. Dr. Walcott says in substance

Explorations of Cambrian and pre-Cambrian for mations have brought to light evidences of life far earlier than heretofore known. The field of the summer a mations have brought to light evidences of life far earlier than heretofore known. The field of the summer a investigations and collecting was the Burgees Pass Fossil Quarry discovered in 1910 but which did not yield its treasures until after years of hard work. Burgees Pass joe 3000 feet shows Field B. C. A section of about 180 square feet was taken out on this trip practically exhausting a quarry which has pelded the finest and largest sories of perfect Middle Cambran Gossil yet discovered and the finest invertebrate fossils yet discovered and the finest invertebrate fossils yet discovered and the half tons of special where Mort than one and a half tons of special.

where More than one and a half tons of spe mens were trimmed out of the shale rocks with minds were trimmed out of the snale reverse with the assutance of Mrs Welcott carried by pack horses to camp and thence to the railroad at field and are now in the National Museum It was necessary to blast out the back wall

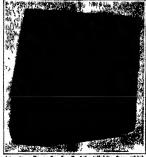

It was necessary to list out the cook wait of the quarry left from previous work to obtain the fine pieces encased in the fossil bearing rock. When the large slabs were finally blasted loose they were carefully split with chisel and hammer exposing the fossil romains embedded between the lammae of compact siliceous shale

between the lammass of compact silocous shale. The remarkable thing about this shale is that it preserved animals that were soft and non-resistant as jelly fish worms and the internal part of worms and erab-like animals. One of those earliest forms on earth, is a swimming crawling erab seven inches long It had two large (yes an front abown by round white spots sax trong ribs and a large tail Branchiae or gails sinne through the thin shell as well as traces of the logs. Another currous the server of the compact of the server of the server of the compact of the server of the serve ber with many flexible podia or false legs. A small round shell happened to rest on the sea bottom just where the head part of the animal was later pressed down upon it Another soft bedied form is Portuli mira related to the bodied form is brotain mark related to the holothurian which may be seen growing on the sea bed at Santia Catalina Island California There was also an imprint of a mud loving Atman which usually lives burned in the sand the shale bed at the quarry suggests that the waters of the amount Cambrain sea above

it swarmed with life just as the ocean does to day at Santa Catalina Island. But this was long before the advent of fishes on earth so there were no fish and no traces of them occur in the fossil bed The superb preservation of fossils at this quarry is all the more remarkable when we consider that they have been buried I comis at this quarry is all the more remarkable when we consider that they have been buried for twenty million vears or more and subject to all the vicestudes that rock material experience from the time they are simply hardened mul lurned binatil thousands of feet of thickness of lyers of multi sand and publish like all wirth changed and of the state o iater compressed at l cl vated into mountain ranges and more or less worn away by atmorio ageneres

How the singue Fty Taxes Host
THE attempt to discover how a "nucking meet
develops the necessity vacuum pressure for such
process has led to many investigations of their mouth
equipment. The probagate and the hypopharynx have
been analyzed ever and over again in this connection, and
special importance has been attached to the contact
totavens the probacate and the surface upon which the
insect feeds, or between the end of the hypopharynx and

The bifurcations on the branch pseudo-trackes, incation is indicated on the previous print

seems to have two rows of these claw like organs There are shout fifty of these to the branch making in all some twenty six hundred on the two labella This exposure shows still greater magnification being made with the 4 mm objective and the same 10x ocular

The final print was obtained with the 18 mm objectwo and the 10x ocular, aided by oil immersion and a lengthening of the camera bellows It shows the brur-cations on parts of four branch pseudo-trachea, Mr

Phillips suggests that the functions of the bifurcated hands as here shown up are intimately involved in the answer to the question which led the question water med him into the investigation How this fly 'bites, as many persons insist it does is difficult to explain unless there is a sharp hypopharynx which may be used as in the case of the female mosquito, the stable fly, or the horse fly Such a possibility seems doubtful, the shape of the proboscis hardly warranting any such assumption Yet the fly seems able to make a red mark on the skin of a chill and to constitute itself a distinct approvence to idults

# British Textile Industries as Affected by the War

The Measures Adopted by His Majesty's Government to Keep Up Supply and Holds Prices Within Bounds By Major H. Bannerman-Phillips

S 1Nt 1 August 1911 Great Britain has been impelled by the overmastering drive of circumstance, to an ever extending control of industry. As the military contentrating all efforts on the war grew more pressure section after section of industry had to be taken over, and in wages prices and profits, from raw material to finished product placed under government control 1 apr cally was thus the case in the textile field. The world abortage of wood which made itself felt

The world shortage of wool which mad itself felt at the hegmang of 1916 forced the government to take steps to ensure not only reasonable price but 1.0 meeting of the heavy demands for military clothing. The home wool clip of 1916 was purchased collection busy undertaken by expert buvons serving for the purpose under the War Office Proces were fixed after airful consideration at 35 per cent above those ruling in

e and July, 1914

The success of this scheme together with the very heavy neutral and American demands for wool led to proposals in November 1916, for the purchase of the Australasian clip This operation, involving an ex-penditure of about \$175,000,000 against \$37,500,000 for the home clip was carried out through the Australian and New Zealand governments which arranged a pur no rather less than 10 per cent below the ruling market figure Valuation and purchase in the colonies was entrusted to committees of trade experts appointed

by the colonial governments
The conditions which operated in 1916 made still more urgent the purchase on the same lines of the next season s British and Australesian clips and as the result of later negotiations a substantial part of the Nouth African clip was likewise taken over In addition to these outright purchases, measures were taken early in 1917 to bring under the control of the Armi, Conin 1917 to bring under the control of the Armis Con-tracts Department all other risw wood and wool products arriving in the United Kingdom. It is of course, to be understood, here and below, that measures introduced in 1916 and 1917 were continued through the

The wool acquired by the British government under emes is distributed, in priority, to governme contractors pro rata on contracts in progress and then, contractors pro rate of contract in progress and seen, against rationing certificates to manufacturers for the home and export trade. In order to stabilize trade and enable manufacturers to compete advantage-only in foreign markets, this wood is issued at prices fixed over periods of as months shead.

periods of aix months aneau

It became evident early in 1917 that the civilian consumption of wool must be curtailed considerably if the sumption of wood must be currained considerably in A Allied military requirements were to be met and an adequate reserve of wood built up against a prospective decrease owing to transport difficulties, in receipts A system of rationing manufacturers for the ordinary home and export trades was accordingly devised. The country has been divided for this purpose into districts which each receive quarterly allowance of the wool available for civilian trade based on their normal consumption allocation of the ration for each district to its man facturers is undertaken by committees appointed by the trade. The total of raw materials (alled for by approved applications is compared with the district ration for the quarter, if there is a deficit the amount to be issued against each approved application is reduced in proportion. The whole rationing scheme is supervised by the Board of Control of the Woolen and Worsted Industries com posed in equal numbers of representatives of employers, employees, and the Army Contracts Department, under the chairmanship of the Director of Wool I extile

There is no doubt that this control has resulted in great remer is no other that the control has resulted in great contonies to the state. Not only has the iffect of war conditions on market price of the raw materials been claimasted but the fixed prices have enabled the govern-ment to control the costs of productions at every stage. The Allied require ments of raw wood have so far as

sible, been satisfied by shipments from Australasia Large quantities were disposed of to the United States rument for naval and military use, in addition to a certain amount for civilian purposes, and provision was made for the wants of India and Canada Japan remade for the wants of India and Canada Japan received considerable quantities of merino tops made from woods combet in Australia Inpa, nois, wastes and yarna have also been frichy supplied the Luropean Allies, and every effort hate been made to assist them in keeping their wooden indestructive working as far as practicable

So much for wool. In other lines, with a labor supply

dininished by the needs of the army, with merecaing demands from Britash and Allied quartermasters, with restricted supplies of raw materials, the difficulty of meeting even essential requirements in certain instances meeting even essential requirements in certain material reducements of the entire output of the industry. If allowed to operate could be considered to the control of the country of the c

Defence of the Realm Act which it has seldom been necessary to put into actual operation. It has thus been possible to secure full data concerning costs and to insure that contract prices allowed no more than a reasonable rate of profit.

The prohibition of jute imports in February, 1917, was likely to lead to undus mission of the value of stocks, so all unsoid goods were taken over by the government on the basis of the market price prior to the emberce. the embargo. As necessity arose this jute was dis-tributed to manufacturers at uniform prices based on co t plus interest carrying and transportation charges Likewise although cheaper cotton substitutes were put in place of flar goods as far as possible the army requirements for the latter were large. In August the Ministry of Munitions took possession of the 1917 crops of flax, as well as of all other flax in the United Kingdom Purchase and sale were published without a license and maximum prices were fixed. (ontrol was also and maximum prices were fixed (ontrol was also established over the transport of flax from Russia Still another article lover which control was set is manila Still another a stele lover which control was set is manua-hemp. About 80 per cent of 1t consumption has been required for government purposes. In April 1917, an order was issued prohibiting all trade in manila-bemp and the government under frock its purchase and distribution for all purposes. It is distributed on

bemp and the government undertook its pureasee and darbibution for all purposes. It is distributed on arrival to ropemakurs at fixed pits which run about \$40 per to holow those rulling prior t roardro! In every tase the result of the summary action outhen has been estatfactory. Liquitable distribution has been estatfactory. Liquitable distribution has been estatfactory Liquitable distribution market prior has been estatfalled free from fluctuations. Competitive buying has been climinated, and the media profits merchanically all the media profits merchanically and the summarket prior private the media profits merchanically and the summarket profits and the summarket the undue profits previously resulting from private speculation have been done away with Above all, full utilisation of stocks without hearding his made it possible to stretch the supply so as to meet the essential demands

The serious crisis in the cotton industry which faced the country toward the end of I me 1917 was of a some-what different character. The difficulty of securing full supplies of raw cotton was one of shipping not one of actual under-production of raw materials. This side by side with the necessity for maintaining a reasonable standard of employment among large numbers of workers, mostly women who could not well leave their locality or be absorbed by other forms of industry led the government to take action. With the cooperation of the industry, a Cotton Control Board was set up. Steps were taken at once to prevent means of the Liverpool outton market and the main question of the dangerously low state of stocks of American cotton was attacked Production of the mills was cut to 60 per cent except in certain cases where a more generous allowance was made under a system of payment of levies. The sum thus utilised in safeguarding the interests of the working people in the less favored nulls prevented widespread distress which would otherwise have been inevitable Concurrently with great soon my in tonnage space an industry vital to Britain has thus been saved from parious dislocation

Before the outhreak of war the demands of the government for leather and leather goods were comparatively small, amounting to less than one per cent of the nation s small, amounting to less than one per cent of the nation s total output in this industry. At the end of the first year of war, those demands had increased from \$1,750,000 to about \$75,000,000 per year during the past 12 months of the conflict they amounted to \$100,000,000

of the commet say an inner or stor, out, our, out it became clear at an early stage that ordinary forces competition would not seeme the supply of materials any reasonable price. The army s demand was in at any reasonable price. The army's demand was in many instances greater than all the supplies in sight, many instances greater than all the supplies m sight, and, had a yetten of competitive tendering been maintained, prices would have risen to absurd heights. It was accordingly necessary to take such control both of home production and of importation as would reader it certain that these demands to most.

In the early part of 1917 the previously constituted

Advisory Commutee dealing with leather supplies was merged into a Central Leather Supplies Advisory Committee, which contains representatives of the oblid federations of employers and the leading trade unions muttoes which have met requisitly and given detailed advice to the central body. The relationship between the government departments and these Committees has been uniformly harmonious, and the existence of the Committees has contributed to the smooth running of the industry, providing, as they have done, an easy dense lobol fee criticism and for suggestion.

channel both for criticism and for suggestion. The large demands for sole and upper leather for military purposes, accompanied by the fact that for these purposes only the best was acceptable, embarrassed those engaged in the production of cirilian boots, while in aggregate the extent of production has not bess curtailed, it was thought soccessive during the summer of 1917 to take steps contring this Britains industrial industrial workers be adequately shed during the winter months Arrangements were therefore made, in consultation with the trade, for the production of war time boots. These have since been supplied in sufficient quantities to meet the demands of the working population, and they will be manufactured and distributed at controlled rates of

In considering the steps taken in the control of in-dustries, reference must be made to the organization set up to utilise unserviceable supplies Special steps have been taken to deal with all worn out textiles Garments been taken to deal with all worn out textiles. Garments condemned by military units are sent to a salvage depot Large quantities of rags are salved from all war areas Cuttings from material supplied to contractors for making up delting are assued as fixed prices to clother contractors. Departments and public bodes have been warned to occanomias in woolens and to forward for mational use all their condemned garments and rags. In solition, steps have been taken in conjunction with the gaussian contractors are contracted to the contractors of 
Arrangements were also made to deal with the a Arrangements were also made to deas with the saving of boots Boots fit for multiary wear are repaired for the purpose. The remainder are graded by prisoners of war under the supervision of trade exports. A system of research has been set up to inquire into the methods of research has been set up to inquire into the methods utilizing old boots and scrap leather in the manufactur of various commodities of which there is a shortage.

In general, it may be stated that efforts are con being made to encourage and arrange experiments to the better utilisation of waste products. Wherever, possible, these are used as raw material for the manupossible, these are used as raw maternal for the manuficature of goods required by the state, but when this is not possible, ordnary trade methods of disposal are induced into, and adopted if found to be advantageous. The amounts realised by the sale of such salvage during the 12 months were over \$7.00,000, and of course the saving in one not to be measured at all in dollars and contain the contract of the saving in one not to be measured at all in dollars and contain the contract of the saving in one not to be measured at all in dollars and contain the saving in one not to be measured at all in dollars and contain the saving in the savin

The statement of value is made merely to give some idea of the claure is provided to the cature in Further steps were found necessary, by means of a savage organisation within the army itself, to extend these operations to all articles of military use. At the amounts a Nakisma halvage Council was formed, many the product of the product of the control of the contro

# Why Does a Crankcase Breathe?

# How Alternate Pressure and Rarifaction are Produced by Apparently Balanced Piston Movements

LATTING a "breather in the createness of a four-sylvander gaschuse engine is a matter of some impor-tance. The alternate compression and partial vacuum taking place in the createness at overy revolution would tend, in the absence of a breather or vent, to force of out through the bearings and then draw it back, along with moore or less dust and foreign matter. The net result would be a very ofly engine exterior, and dray

remait would be a very oily engine enterior, and drty bearings.

This leads up, however, to sumsthing of a pussis, for either giving the master a little consideration one might will ask viry there should be alternate compression and partial resums in the crankonse. The crushit are set at exactly opposite joints on the crankonfart, two on made and even on the other theories there must always and an extensive state of the same and the same and the same and an experiment of the same distancer and all have precisely the same length of strokes, apparently, therefore, the displacement of air by the two descending part of pations. At that rate there would never be any change in the valued contents of the crank case and cylinders and consequently no change in precisions should be succeed to the control of the same remains of the same of the control of the same that there is a slight of the same of the same true that there is a slight of the same of the same true that the pations travel at eachly the same speeds in opposite directional? It is plant that the pation starts from a dead stop, gradually meadernate until it reaches the other dead center and stops before starting the return story the other same center and tops before starting the return

slows down toward the end of the stroke until it reaches the other dead center and stope before starting the return shocks, so that the motion is to some extent trequilar, but at not true that whatever one patton is doing any, on the down-stroke, the other is doing on the up-stroke? Curnously eneugh, such is not the rase. The truth is that the peston travels through the first half of its downward stroke—that is, the stroke away from the opinder hand—at greater peed than it served strongs the less half of the same stroke. On the up-

stroins the first half is performed more slowly than the second is moving more reported that a pattern making the first half of its descent is moving more rapidly than a pattern making the first half of its ascent, and displaying more art than the other makes space for with the result that the pressure in the straining the first half of its ascent, and displaying more art than the pressure in the straining pattern is obviously down while the ascending plation is accelerated, and the result is an increase in the total amount of space and a slight degree of vacuum. Thus there are two shanges in crankcase pressures at every reventure of the carakhaft.

At the bottom of all this is the angularity of the connecting rod—that is if st operature from the vertical in the case of a vertical engine or in any case the fact that the crank and moves alternately away from and toward the produced axis of the offinder. To explain the phenoms non let us connect the downward stroke. It motions of the crankprin is a compound of vertical and horizontal motions.

of the craskpur as a compound of vertical and horsaontial motions. It is clear enough that the vertical motion of the craskpur must be followed by an equal vertical motion of the pation to which it is connected. It may not be quite so clear however that the horsacnial moves must of the enaltypur-chait is its rawing out from the center line of the cylinder—also produces vertical move-ment of the piston which must be added to the other Perhaps the easiest way to explain the point is to imagini the connecting row with its imper and in the unital place in the piston but the lower end instead of being on the resistion acraised so that it could move only in a eranipin arranged so that it could move only in a straight horisontal line Starting with the connecting red vertical let the lower and be moved horisontally. The riguit will be of course a downward movement of the purton. The pourt can be practically demonstrated by holding a pencil vertical to the table and moving its lower and along the table, which will as set the upper end to be lowered

Thus the puston in following the first quarter revolution of the crank moves vertically through a distance equal to half the stroke plus the extra distance due to the angular

rty of the connecting rod this distant depends upon the length of the rod in proportion to the length of the stroke. In the sound quarter for the revolution the puston still moving downward the rank end of the puton still moving downward in rank end of the connecting not revenue to the recursor of connecting not revenue to the recursor of component and moves inwarf. Lepermenting with the priced it is found that coming lank to a vertial position raises the upper and. In the rane of the puton the virtual commonent is much great ritain the horizontal so the puton continues to move downward but the inward swing of the animal time real glows if down and shortize its (second that animals time real glows if down and shortize its (second time). the connecting rod slows it down and shortens its travel as compared with the distance traveled during the first as compared with the distanct traveled during the first quarter revolution of the trank Bradty while the erank goes through the first quarter revolution this parter makes sometiming more, than last its stroke. But the the orank goes through the account quarter the piston makes sometiming less than half its stroke. But the fly wheal keeps the crank turning at a speed that is constant throughout the volution and as a result the long half of the struke is done in precisely the same time as the short half.

In the first part of the up-struke the crankpin swing in the first part of the up-strukt the erankpin swings of from the centre, the results being the subtraction of something from the upward travel that there is a short strice just as in the last part of the down struk. In the last quarker of the revolution the erank is again swinging in and the addition to the v ritical compount makes another long stroke as in the first part of the down

strok:
Now for the breathing. The point is simply that when
one pair of pations is making a long stroke the other as
always making a lond stroke though the time is the same
for both. While the disacading pations are moving
faster than the ascending pations are moving
faster than the ascending pations move more
rapidly than the dewix oding pations arout move in
formed. So the crankease breathes even though a
superficial connectation of the mail'er majet makes's seen
impossible for such action to over;

# Lake Michigan's Encroachment on Its Coast

# How the Carrents are Stealing Land from the Western Shore and the Giving It Back at the Southern Extremity By Hu Maxwell

DURING 4,000 or 5,000 years the waves of Lake Michigan have been encreaching on its western show from the lodician state into northward into Wincombin, and within that time the waters have pounded made and within that time the waters have pounded not not to the property of the property

In most places bluffs, ranging in height from a few feet to 70 or 80, constitute the shore and the waves of the lake make their attacks against the bases of these bluffs. The soft material crumbles, slides into the lake and disappears Canual observation is sufficient to show that the process is rapid in some localities and slower in others while in a few places the shore is holding its own, without any assistance from man, and has not recorded any in

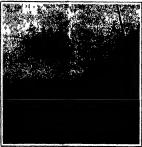

Public land on the western coast of Lake Michigan Fuller and on the weetern construction in the district under consideration, was surveyed about the year 1835 and monuments were set up at that time at various points to mark the survey. These monuthe year 1835 and monuments were set up at that time at various points to mark the survey. These monuments now furnish the means of estimating the rate of the lake a encreachment upon the land. The advance of the water and the recession of the above may be measured, and the average may be calculated for a period of approximately 80 years. The rate of recession has wared greatly in different localities, due to local influences, such as contour of the shore exposure, form and material of the banch and the set of the currents, but the average for the whole period since 1835, calculated for 180 miles of shore line port-band from Chicago, shows that the water has sent-cached upon the land only a little less than three feet a year.

less than three fact a year During single years the inroad at certain points he een much greater than that A strip of land 16 feet sep along a part of the campus of the Northwestern Geep along a part of the campus of the Northwestern University at Evanston, Ill, has been washed away in the space of 12 months, and a similar rate has been noted at the point where the Wisconsin-Illinois line meets the lake In other localities little or no encroachment is now taking place At Waukegan for example, the she line has been stationary a long time

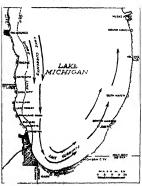

The question naturally suggests itself During how long a time has this encroachment of the lake upon the western shore been going on and where was the be-

Data worked out by the Coast and Geodetic Survey for the government help to answer the question Lake soundings reveal a submerged plateau or bench along that

part of the shore which is here under consideration. The water which covers this bench is shallow, ranging in depth from 30 to 60 feet, and the plateau extends out from the present shore several miles—two or three in

Rapid destruction of the lake shore at Bracelde, Ill

at and furmer above line of Lake Michigan Correct that have piled up all this land at the accellate and of the lake

some places and as much as eight or nine in others Beyond the outer edge of this plat u the bottom of the lake pitches abruptly down several lundred feet

That bne marking the division between the shallow and the deep water is evidently in the place where the old shore once stood. It was the coast line of the lake before the waves began cutting back into the land.

The submerged plateau or bench represents the area of encroachment about 600 square miles as already stated

Here is a basis for an estimate of time and if the figures an correct even within a pretty wide degree of approximation they seem to bring the ice Age considerably nearer to the present time than it has been generally At any rate it is interesting to take the encroachment as a factor and see what the result is

Assuming that the rate of recession during the past 80 years is a fair average for the whole time it may be shown that Lake Michigan began its attack on its western coast about 4 700 years ago. I hat was about the time that ( heops king of Egypt set his slaves to work building a pyramid to perpetuate his memory not know that any human beings lived on the shores of Lake Michigan at the remote age. The bluff deposits along the lake have not yielded any human relies of fossils though there is little doubt that a few principalist Indians had followed the retreating ice of the Glacial Age northward and were on the lakes shore even at that remote time. But whether such was the case or it has nothing to do with the geological question involved

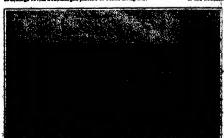

Interest in important occurrences though remote should lead one to inquire why I ake Michigan should have commenced cutting away its western shore at that particular time for it is as certain as a geological fact can be that the lake was there long before. Why did it not bugin its attack before!

The cause for the commencement of activity at that time is known with reasonable certainty but the evi dence is geological rather than historical

The lake s surface it is believed mached its present level at that time and then began the attack on its shore which has been kept up ever since. Before that period the level of the lake was 50 or 60 feet higher than at and the surplus water of the lake flowed away toward the Messissippi through a river whose channel remains to this day high and dry westward from the southern end of the privant lake. It is supposed that the water was held at that high level by an ice gorge or a glacer which prevented escape by way of the 5t Law rence vality as the lake is drained at present. That condition doubtless existed many thousands of years while the Glacial Age was drawing to a dose. Finally the ne obstruction gave way the imprunded waters of the Great Iakes flowed down the 'st Iawrence valley Take Michigan sank to its prient level and it was then that the water began to wear away the shore. Apparently the time has not much exceeded 5 000 years since drainage to the Mississippi ceased and the lakes present level was fixed. The old drainage channel was forested over or grassed over when white men came but it was so evidently a liver channel that it was recognised as such by the earliest pioneers men who had no knowl-

edge of geology

## Amateurs in Name Only

A Story of What the War Has Done for the Cause of Amateur Wireless

By Austin C. Lescarboura

It is no simple matter to explain why there are several hundred thousand surviews amuteurs in the United Btates today. It is difficult to understand why a young man should place his bard-asmed asvings in an elaborativaries of the strated of a motorcycle or motorboat. It is pussing to find boys young men and oven siderly men spending hour after hour of spare time patiently adjusting the knobe of a collection of instruments while listening to long and short buses and whatle like notice

worn on the head

Yet the fact is that the wireless amateur exists—and in vast numbers. Lven two years of enforced suspension of this hobby, due to war regulations has only served to stimulate interest in amateur radio Indeed not only are all the old wireless amateurs reopening their wireless stations, but many newcomers have entered the field. The numerous important advances made in wireless telegraphy and telephony, made in wireless telegraphy and telephony, and the startling application of these methods of communication, have served as nothing else could serve to stimulate a broad interest in this strange hobby

#### Kilowatts on One Hand, Microwatts on the Other

What makes radio communication so fascinating? Perhaps the answer may be found in the super-eavosdropping feature— For instance an amateur possessing a high grade receiving set can, while sitting in the attic of his home in the suburbs of New York listen to the messages from coast stations steamers battleships and even the powerful wireless stations of Furope By the manipulation of several knobs he can tune in with

the Liffel Lower at Paris, the station at Lyons, the enemy station at Nauen in Germany and the station at Rom lie is in tools with the important centers of the world, and he receives important receives of the world, and he receives important press depatches long before thy appear on the builten howdra and in the newspapers And all this without leaving his chair in the attuAt the present writing the Covernment ban has been raised on receiving stations only and the time has not account of the property o

yet arrived when an amateur may operate a transmitter

N response to many requests on the part of readers of this journal there has been prepared a special series of articles on the broad subject of amateur wireless telegraphy and telephony. This series, which will appear regularly in the Scientific American Supplement and which begins with the usue of July 5th, No 2270, constitutes a practical working guide total to work. It is non-technical, yet it covers every important phase of post bellum amoteur radio. Its authors are Louis Gerard Pacent and Austin C Lescarboura, both of wham are well known to the radio amateurs. of the country —THE EDITOR

> However it is now but a matter of weeks or even days when the ban shall be completely removed and then the air once more will be crowded with amazur messages passing back and forth Obviously a wireless station is not complete if it cannot transmit without a transmitter one can listen without aver answering or question. ing but with a transmitter one can communicate with distant friends and acquaintances and earry on a regular

Still these matters of super-cavesdropping and con-

rezung through space do not quite cover the fasednatum of ratio communication. There are assatsure who devotes most of their time to wring and seventing and arranging and rearranging their apparatus. They suit all sort of queer contexptons with which they appeared by the hour, testing them for receiving or sending as the case may be These anatheurs, no doubt, are fasemated by the intenselse and mywherke of electricity as applied in adult work. One does not begin to appreciate the marvals of electricity and one delves into radio communication, where on the one hand to current its handled in kilowatts for the purpose of transmitting over longer of the purpose of transmitting over languages while on the other its intercepted and passed through the receiving entit.

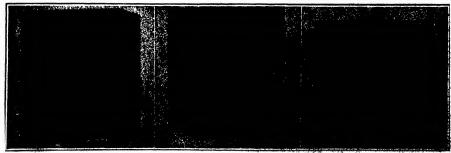

apparatus in volumes only measurable in improvatts or millionths of a watt, a watt being the electrical equivalent of 1/748th

of a horse-power

Then there is the matter of the inventive

Then there is the matter of the inventive impulse. Radoo communication is rich in possibilities, in truth, more than one commercial score in truth, more than one commercial score in truth, more than one commercial score in truth, in the commercial score in the principle of the leading engineer in electrical and viroless organizations began their carross and the commercial score in the co

full-fiedged wireless amateur

The first and second views show the exterior and the interior of a receiving not, while the third shows a vacquest take unit

thuted a number of inrations. Not the least portant of these is the le application of the application of the vasuum te mployed by the more proive amateurs in pre days, is now used for trans-mitting as well as receiving The vacuum tube is nothing more than an electric lamp of the incandescent type, of the incandescent type, containing one or more elec-teredess in addition to the filter of the continuous of the execution electrical characteristics electrical characteristics electrical characteristics electrical characteristics and these have been supplied that there exists and these filters are employed for detecting are employed for detecting the weak nursuants induced in the weak currents induced in the receiving set by the distant transmitter, for building up or amplifying these

weak currents in the event that they are too weak to be heard in the receivers after seast time are to weak to be near in the receivers at a passing through a single vacuum tube serving as a so-called detector, for generating high frequency currents used in transmitting wireless telegraph or telephone messages, and for modulating powerful currents by means

messages, and for modulating powerful currents by means of relatively weak currents.

Vacuum tubes are so much more sensitive for receiving purposes than the former crystal and other types of detectors that most amateurs will use nothing clse. At least, an amatour may start with the far sumpler inscae, an amount may start with the lat simpler in-struments for receiving, but sooner or later he comes round to the vacuum tube receiver, just as the man who starts with a \$500 automobile often climbs by easy stages to the \$7,500 car. The simple receiving set, costing but a few dollars, may serve quite satisfactorily for recoving messages from nearby stations. However, when the amateur wishes to keep pace with other amateurs who are in daily touch with European, Central American, and Padio Coast stations, he must purchase the very

and Padine Come seasons, no must purchase the con-best apparatus for the purposes. The vacuum tubes have made wireless telephony practicable and relatively meropanive. Heretofore, the continuous waves required for wireless telephony were usually generated by an electric are, with all its attendant usually generated by an electric are, with all is attendant rotubles such as heavy cutrent consumption, elikekring, fluctuating oscillations, microphone troubles and so on Today, thanks to the vacuum tubes avaisable, wireless telephony comes well within the reach of the average manteur A simple vacuum tube may be used together with some form of inductance, capacity, simple microphone, motor-quentrois set for supplying a bigh-voltage directs current, and other accessible to the supplying a bigh-voltage of the supplying and the supplying a single voltage of the supplying and the supp

mobile or motorboat, so that he may keep in touch with his home or office and with other stations Another mnovation brought about by the war is the loop. As its name indicates this device is simply a loop consisting of numerous tirms of wire. For amsteur use. consisting of numerous titrus of were For amateur use, the loop may consist of 12 turns of heavy were with the turns spaced 1/4-inch apart and if one desires to receive from long-range stations, the loop may be wound with 40 turns of wire The loop serves as the aerial for re-ceiving or sending. One side of the winding is attached to what would ordinarily be the aerial connection, while the other is attached to what would be the earth con-

The loop, which is shown in the cover illustration of The loop, which is shown in the cover illustration of this uses, simplifies the smatters problems. It used to be necessary to erect high poles between which were stretched the wires forming the aerial system. But, owing in large measure to the extensive use of vacuum owing in large measure to the extensive use of vacuum tubes as detectors and amplifiers it is now possible to intercept wireless waves with a simple loop placed in a room. Almost he end of interceting experiments can be carried out with loops, for those wave interceptors have marked characteristics such as direction finding and miterference prevention. A loop enables one to be one more than the property of the control of the long more property of the control of the control of the long more property. Seterime the direction from which bass of the radio ompass used by vessels and aircraft. Again the loop diminates much of the atmospheric electricity or so-called "statu" which has heretofore interfered with long-distance wireless reception.

#### Getting Along Without Anten

Some time ago the technical press brought out the details of an underground system of receiving perfected by an American during the course of our participation

in the world war This system makes use of a burned antenna, and, aside f in the convenience incidental to doing away with elevated wire systems climinates most of the static interference taki: g plac in the wireless world i out which the amateur is not immedi tely informed it may be safely assumed that numerous amateurs will resort to thu amateurs will resort to this system or a modification of it As it is, for years ama-teurs have made use of ity gas and water pipes for antenna and ground purposes respectively Truly, there is very little that anisteurs have not done by way of getting round the antonna problem, especially when confronted by a landjord with very little symsenner-in the radio direction, at least Fire-escapes, bell wiring metal bedsteads, telephone lines and electric power lines tapped through

680

a condenser so as not to interfere with the electrical arrangements—these and nany other improvisions have served as antennas where

While almost any metal mass will serve as an antenna for receiving something more substantial is required for transmitting signals. As soon as the ban on amateur transmitters is removed there will again appear the masts and elevated wires on many of our city apartment houses and country homes

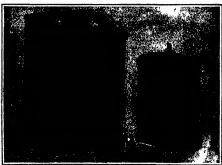

houses and country homes
Turning to the question of apparatus one finds that
a marked step forward has been taken In antebellum days almost anything went as wriceless apparatus
In fact, nune-tenths of the Amateurs made their own
apparatus from odds and eads, and opparating convonience counted for next to nothing But when the
war called many of these same amateurs into the inavil and military service they became acquainted with com morcial apparatus and soon forgot the home-made material and crude apparatus generally sold some years back. At present these so-called amateurs who have been serving in a professional capacity for the two years of our war are coming back into the radio experimental field with professional ideas as to equipment. They are demanding the same grade of instruments as they used in the (levernment a rvice and they are getting it

Pre-war amateur wireless equipment was made mostly Pre-war amsteur wireless equipment was made mortly of wood for mounting the metal parts. Cheapness was the paramount consuderation. Typewriter knobs were used for manipulating the various components, plain switches, stock binding posts, cheap mickl-plating. So much for the outside—the only part that showed, and it is left to one a imagination to determine what must have been the condition inside—the part that did not abow. Still what could one expect when the price was

#### Mud Geysers at Salton Sea By Charles Alms Byers

ON the east rn shore of Salton Sea about set n miles from the small town of Nilas I (al there recently has mul genera. The field covers at present an area of a little more than two acres and comprises a conparatively level expa save for the geyser n unds themselves from which the water f this unnatural mian I sea has gradually recoded as the result of rapid evaporation. The area is already pute liberally lotted with the mounds and new ones are from time to time being adde

mounds and new ones are from time to time being added into one-alled govern in mud volcanors somewhat recombing huge crawtah houses are varousessed that the second of the and seem will shoot right in the air. At su it times a strong smell of sulfur or alseme is noticeable. These explosions are naturally occasioned by the gradual ac cumulation of peckets of gas and so terrific is their force that they sometimes have torn holes in the earth from 4 to 10 feet wide and to a depth of 10 or 12 fe

The govers frequently first appear as small spring like fissures from which the mud bubbles but intermittently and some f them seem to develop into nothing more Others either through gradual development or by suddenly springing into existence with a loud explosion become great pot-shapid caldrons some of these having finally by the steady overflow or the successive spout ings of the mud built up about them mounds as high as

Salton See on the shore of which this field of mud Sation Sea on the store of which this held of muse gaysen is located was until about 15 years ago a dry salt-encrust d area known as the Salton Basin or Salton link with a maximum of 265 feet below sea level In the latter part of 1004 the Colorado River entered upon a series of high water rampages and as a result tempor a series of initial water rangesce and as a restart support and youngerted a large irrigation canal which tapped the stream and supplied water to several thousand acres of fertile farming land in the Imperial Valley into a veritable river. The water thus diverted into the vertable river line water thus diverted into the irrigation canal sought out the lowest depression within reach and hence poured into the Salton Sink After about an unsuccessful attempts permanent control of the canal and river was acquired in the spring of 1906 but in this interim of more than two vears the hithertodry Sink became a large lake embracing an area of about 400 square miles

about 400 square miles
Since the stopping of this inflow of water from the
Colorado River Valton Sta has been rapidly shrinking
through infansive evaporation. In ten years for in
stance the lake recorded to about 93 000 acres. Scientsets claim that this shrinkage will continue until 1928 when if the present rate of inflow from two small feed rivers is maintained, the lake will be a permanent stationary body of water covering between 40 000 and

The present field of mud geysers is the reappearance of a similar field which existed prior to the lake s formation though the area they now cover is larger the bubbling mud pots are much more numerous and more active. The report of the United States Geological Survey for 1902 for instance mentions four mud volcances southwest of what was then Imperial Junction and is now known as Niland They

are explained in this report as fissures extending from subterranean bodies of steam similar to those in Yellowstone Park but not so active.

The mud is created by the falling into this steam body of the fine sut forming the surface amend of the fields Nicks crust of the Salton Sink

crust of the Salton Sink
The reappearance of the mud geysors made
possible by the recognion of the water from the
area, after boug submerged for about 13
years occurred during the early part of 1918,
presumably as an accompaniment to rather
evere earthquake disturbances in the winds? A number of milder shocks have occurred sin then and during such times the govers show a

#### New Lead-Burning Transformer for Storage Battery Work

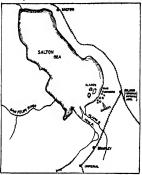

THE most modern method of burning terminals in place on storage batteries. termenals in place on storage batteries, up posts, or in fact almost any form of lead w is to do & electrically—by the electric welding

the new field of mud comes built up by poyor action in the Salten flink when that busts was resided by eartheurises

The last word in elsedre lead-burning equipment is shown in the accompanying illustration. The transformer of the set is designed to be connected to the ordinary 110-voit alternating current lamp socket, a 10-foot cord with plug being provided for his purpose. This attaching cord is prefected by a special rubber covering against the hard wear durt and acid with which has been considered in the contraction of covering against the hard wear dirt and acid with white it may come in contact. Connection to the transformer itself is made by means of a plug and socket connection so that this plug can be used in place of the snap-switch in the lamp socket for turning the current on and off

red terminal leads are used Two separate rubber-cove

Map of the Salton Sea showing the location of the mud goysers

to convey the low voltage heat pr slucing current to the parts of the battery to be welded. The lead having the large clip is fastened to the battery plate or post which is to be worked on. The other lead has at the end a carbon holder which is arranged with a heavily insulated handle so that the operator's hand is guarded from the heat The carbon holder takes any ordinary are welding carbon

The carbon holder takes any orthinary are wedding carbon this carbon forming the second terminal. When the pointed are welding carbon is brought into contact with the lead the pointed end of the carbon becomes intensely hot so hot in fact that it nielts the lead over a restricted area quicker than a pointed

shirting the advantagement the lead burner is that regard work in ground correct such to despect more a table has in always rights not the poin surface, the division is readily wrighting approximately; 35 postudi is not have to be eleaned as the alag notomatically rise to the smith alag notomatically rise to the smither while deanneed. When properly is

while described When property is no glare to injure the operator's eyes, as he is on the cool and of the carborn is such a way that point where the carborn touches the lead is he view. There is no danger of electric shock

view interes is no canger of accessors assout coccases of efficients insulation.

On the basis of 10 cents per kiloweth hour, it cents about sight cents per hour for oursets when the sevice is operating steadily. The instant the carbon point is removed from the work, the ourset consumption prea-tically coases at the device takes then only 4% water from

the line Owners of these transformers have found an interesting field of application. The device is said to be especially valuable to actionable owners in reconstructioning and repairing storage batteries. In the shop and foundry it has been used where all inted of odd siddering jobs must be done. The device has also been found applicable in plumbing, reoling task building site.

### Classifying the Stars by Mondelieff's Law

Classifying the Stare by Mesodelled's Law THE stars are usually divided into a principal classic according to the spectra they exhabit, as follows Class O stars of the Wolf-Rayet type, B, belliom stars, O stars of the Wolf-Rayet type, B, belliom stars, M, order of the most characteristic substances and the star of the most characteristic substances in the beautiful control of the star of the most characteristic substances in the spectrum yielded by the light from the star. It is now proposed according to a writer in the Reme Sessenfique (Paris) to make Memdelled's Law the beast of Cassification This well-known law divides the abmentary or simple subvisances into sight classes, such or which contains bodies with indisputably analogous properties. The following table shews the first three members in anch class, the valuones with respect to hydrogen being indisorded by the numbers at the top 8 3

0 He Ba Mg Ca Bo Al Ba N 0 Ñe Ų. Ag

Evidently it is quite feasible to piace each star in that one of these cight classes which contains the element characteristic of its spectrum. By nankogy with the theory of fir Norman Lockyer it may be scoped as true that the multivalent elements tend to dissociate progressavely in proportion as the size it may be scoped as the that the multivalent elements tend to dissociate progressavely in proportion as the size increases in temperature. The maximum temperature occurs in this stars characterized by helium, an element whose valence as 0 then under the influence of a lessuaing temperature the atoms recombine and an increase in valence causes.

Dirigible constructed by a French sirship builder for the American Army

#### & Dirigible Armed With a Common

WAT may be considered another revelation of " a another revelation of the great war is the diruphle shown in the accompanying Businations. This drugble, of the Eodina type, was con-structed for the American Army by a French builder of lighter-than-air type air-I lighter-than-air type sir-raft, and is armed with a issa-inch quick-firing can-on, as shown. In the absence of definite

is, the length of this sirship appears to be about two hundred and fifty feet. The

sacoule or oar is said to be armored, at any rate, it is unsusually roomy for a dirigible on such small saie. The power plant consists of two engines, placed on either side of the fuselage, as shown in the second disstruction on this page.

The cannon leads one to be was intended for combatting sheve that this dirigible

MEASUREMENT of metallic objects to as-certain their exact size and shape ordinarily takes a mechanical form. To be it would usually be ble to find wheth possible to find whether as netallic part were too large or too small by attempting to put it in the pisce pro-vided for it, or by trying to use it for the intended pur-pose, but seldom would this process show just where and how great any disorepancy might be. er a

might be.

In the case of glass lenses
and murrors, however, the
reverse is the case. These
are intended to reflect or
transmit light; and the reflected or transmitted light;
is visible Morover, it is
visible Morover, it is
visible Morover, it is
visible and alone as a whole,
but with reference to the
rays that comes from each
point of the glass. We can see the glass work, and see
just where and how great any discrepancy in its working
if, it is possible to test the glass by actual performance
This does not necessarily involve even removing the
piece from its work.

a from its work peace from its work-ing position on the grinder or polisher Thus, in the manu-facture of the para-boloidal mirrors for

nemit light to a

formance of the marror is shown in one of our cuts.
The other picture illustrates a second test which has
to be applied to the scarchlight reflector before it is
accepted by the Government A large carboard screen

Secolie of the American Army dirigible, showing the quick-firing cannon up front

de American army dirigities, showing the quick-firing cannon up front in that circle Under this form on take place with the property of the pr

local fault in the grinding of the nurror. If however a glass passes both the tests it is satisfactory and goes at once to be silvered

An tir interesting de velopi et which is to be secr in the 1 p at the first of 11ftl Street where many of the sarchlight reflectors for the Government were made during the war is i circular-parabolic mirror. The convex side of the big glass which takes the motallic reflecting film must of course le parabolic But there is no parti ular reason other thin custom why the inner one should be ground to a paraboloidal form When

Army to a parabolosistal form. When it is no ground the mirror us naturally of uniform thickness throughout the same amount of glass is found near the center where there is little or no danger of breakage as at the ciges where this danger is present and has to be guarded against Hence the narror is very weighing at times

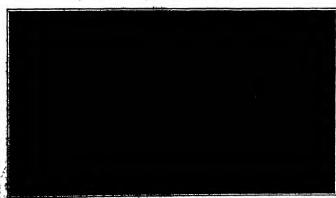

werst hundred pounds

The new idea is to grind the inner concave surface in the form of a spherical seg ment The radius is so glass are of the necessary thickness while at the center the sphere approaches much closer to the parabeloid sur face than before This is feasible because so much of the central segment of the paraboloid as is used for the paraboloid as is used for the mirror is flatter than a sphere of comparable size Of course if the two sur-faces were extended beyond the eirck that bounds the mirror since the curvature of the circle remains constant while that of the parabola increases quite rapidly beyond the immediate vicinity of the vertex the sphere would soon run through and outside of the paraboloid but this

tor that a 60-inch ri flector made after this scheme weighs barely 70 pounds, two men one at either side can move it about without knowing that they are lifting anything, and hence with no

#### Under-Water Storage of Loga

STORING logs under water will prevent blue stain, checking insect attack and decay (The logs would of course, be subject to marineborer attack in salt or brackish water along the sea coast where these pests are active ) Wood of any species com-pletely subnerged in water will resist decay indefinitely wetting and drying, how-ever favor decay

erablight restorate. The rided serven must be visible the paint proper State in the smoke-class produced or the

## The Heavens in July, 1919

## The Dimensions of the Universe, as Indicated by the Milky Way

By Prof. Henry Norra Russell, Ph.D.

As we stand on a dear mornless summer night and face southward we led ild one of the most remark a line southwaru witting one of the most runary asho of seismal spectacles. It is not to be constillations of summer that this statement refers they are indeed conspicuous and contain many stars which are very runor and of great brightness but even the most distant of the stars vanile to the unantid eye of run but the foreground to the greater picture with with we have now to do. It is the Milky Way win his after all the dominating feature of the summer ak. As we follow its mighty arch from the northern to the southern horizon we notice at once that in it is northern havens in Persons and Cassiopeia it is relatively faint that it becomes much brighter overlead in Cygnus and that to the southward between A 41 ha and Engittanus and in the latter constellation it is extremely bright and full of clouds and patches of light

A second mere careful giance suffices to show that in addition to this brilliant str im of light there is a second and fainter one parallel to it and lying to the westward (or to the right as we see it) Tracing the two back to the northward we find that they run together somewhere overhead and that the northern Milky Way,

somewhere overhead and that the northern Milky Way, though irregular in outline shows no such double structure. If at some other asson of the year, we observe the part of the Galaxy which is now below our bear to the Galaxy which is now below our bear to the control of the Galaxy. which is now below our horis in we find that it consists of a single stream of ir regular breadth relatively faint north of the equator in Auriga and Gemini then brightening a little but remaining single to the southern horizon. In more southern latitudes where the part of the Milky Way which is invisible to us can be seen it is found that on this side of the heavens too, it brightens up greatly in southern declina-tion. Though in Orion and Canis Major it is relatively poor in Argo it becomes brilliant and this more conspicuous region extends on through (entaurus and the Southern Cross until it joins up with the bright region in Sagittarius. The two branches of the great stream of light which are lost below our horison in Sagittarius remain separate for some distance farther south but rejoin one another near the Southern Cross

Considering the Milky Way as a whole, then two facts stand out prominently. It is very much brighter on one si le of the oclostial sphere than in the opposite region and it is split into two for about one-third of its whole extent this division occurring on the side of heavens where it is brightest

When seen from southern latitudes— for which alone the finest regions of the Milky Way from Argo to Sagittarius are the northern parts of the Galaxy is so plain that it seems remarkable that so little attention has been paid to this feature attention has been paid to this leature until within recent years. One cannot help saking questions about it. Why should the Milky Way be so uneven and why should it be split lengthwise the way it is?

The answer t the first question is really almost vious. The Milky Way looks much brighter in the nowhere near the cutter of the universe of stars Indeed, nowhere hear the collector of universed stars induced, it looks for m present evidence as though we were well out toward the side. Consequently when we look toward the cetter we are a great many more stars than when we look away from it and the Milky Way appears

correspondingly brighter
This fundamental is t was first fully brought out by Shapley s rem rkath investigations on the glob general direction of Sagittus is and that its distance is general direction of Nagitta is and that lie distance is probably something its a lundred thousand light years. The reason why this we not realized long ago is that studies of the brighter stars—those vanish to the naked eye, or visible in telescopes of moderate power—as about as many of these in one part of the Milky Way as a mancher. It was therefore supposed that we ware near the center of the Universe. When the actual fact was that our applorant in had not taken us out to the

edges at all be distance at which individual starp—

one the brughtest—will look bright enough to us to be

mille to the nacked eys is not, two or three thousand

light years at most, and very faw indeed of the stars,

which are visible in a small takescope can be as much as

twenty thousand light-years away. But the distance to

the limit of the 'Universe (takes, is, of the region where

the stars are abundantly needled through space) as

greater than this, even on the side away from the center

All our soundings appeared to be equal, because they all

should have recorded 'N bo tottom so long as they were

made in the Milky Way. In other parts of the sky,

where we can look obliquely across the relatively thin

layer of stars of which our universe consusts, we do strike

bottom and we find fewer telecopy stars, and aver fewer layer of stars of which our universe consuta, we do serve bottom and we find fewer telescopy is stars, and even fewer vanish to the naked eye, because we see clear through the star-sown portion of space into the vast void beyond But to do this in the Milky Way when we are looking

along the great layer of stars, and not across it we must study the very faint stars, which are individually in-significant, but so enormously numerous that their embined light forms the great star-douds which are so conspiruous to the eye When we do this, it is obvious at once that we come near reaching bottom, if indeed we

At 10 o clock Aug 7 At 914 o clock Aug 14 At 9 0 clock Aug 14 At 12 o clock July 7 At 11 14 o clock July 14 At 11 o clock July 22 At 1014 o clock July 30.

NIGHT SKY JULY AND AUGUST

do not actually strike it, in the thinner parts of the do not actually strike it, in the unifore parts of the Milky Way, in the northern sky—though to do so we must probably extend our investigations to a distance of thirty thousand light years or more But in the opposite quarter, in the brilliant southern regions, no one knows whether we have struck bettern yet, although Shaping settimates the distances of some star-clusters as 200,000

light-years to look as though in some places—notably the dark lane between the topo branches of the Milky Way——re struck a false bestim But an explanation of this must be deterred until next most.

As our map shows, the star-clouds in Sagittarius are now well rimble, due south, and at their present altitude along the stream of the Milky Way, but in reality far means to us, appear the sfars of the constellations flooring and Sagittarian is the south, Ophicase and Aquille higher up, Lymaind Opmus nearly overhead, and Applies higher up, Lymaind Opmus nearly overhead, and Caphus and Cassiogais it life north. The seaters sky is dull, except for the great square of Pepsaus. Capitarium and Aquille Augustain, the Southeast, are honomapienous. The western sky is better, with Yirgo setting, Bottes

above, then Corona and Heronies. Dras Major, in the northwest, with Draco and Ursa Minor in the north, complete our list

Mercury is an evening star and is well visible in the middle of the month. He is farthest from the mm on the 18th but, as he is moving southward can be best seen a little before the date, when he sets about 9 50 P M, summer time.

The most time.

Years for an avening star, and reaches her greatest clongation on the 5th, when she is a little more than 3t degrees from the sun. She remains in agit until after 10 30 P. M. and is extremely complication.

Man is a morning star in Genemit, rising luttle more than an hout before the sun. Suppler is in conjunction with any in the sun of the sun and the sun of the sun and the sun of the sun on the sun of the sun of the sun on onjunction with Yeaus on the afternoon of the 3th. He is in conjunction with Yeaus on the afternoon of the 3th, the two planets being 10 muntes of are apart, so that they can hardly be separated at a glane. Later in the month the ringed planet will be below Yeaus, but above Mercury, and might be mistaken for the latest by a hasty or tumine of a quartum, and comes to the meridian about 4 A. M. Neptune is in Cancer, and is too near the sun to be observed.

The moon is in her first quarter at 11

The moon is in her first quarter at 11 P M on the 4th, full at 2 A M on the 13th, in her last quarter at 7 A M on the 20th, and new at mudnight on the 26th She is nearest the earth on the 23d, and one is nearest the earth on the 23d, and farthest away on the 7th. During the month she is in conjunction with Yenus and Saturn on the 1st—a pretty eight—with Uranus on the 16th, Mars on the 25th, with Uranus on the 16th, Marc on the 16th, Jupiter on the 26th, Neptune on the 27th, and with Mercury and Saturn on the 28th. No news yet has come regarding the eclipse of last month, and it may be some time before the results are fully known Princeton University Observatory

#### An Indoor Jack for Heavy Work

An indeer Jack for Heavy Work

TOR quick stoom in shifting cars or

trucks about in the garage, showroom, service station, tire shop, etc

there is need of a strong compact easily

operated, quick-seding, sack that will

both lift and transport. The short construction of the jack illustrated is a big

advantage in these connections the

length over all is but 40 inches, which

easables the implement to be manipulated

to room official to organized market.

to good effect in cramped quarters

Another distinctive feature is that the wheels of the jack pivot and are guided and controlled by the handle By being able to cut the wheels to right and left, able to out one whosis to right and left, it is possible to gain a degree of quick handling and accommodation in crowded spaces which even the short construction of the jack slone would be powerless to give This applies either to the manipula-tion of the jack alone, or of the jack when

supporting a car
The leverage is sufficient to lift 5 000 pounds with ease. The ratchet has a range enabling any car to be lifted high range enabling any car to be fitted night enough for any purpose with at most two strokes of the handle. The quick release latch provides for a rapid return to minimum height

The tack is so designed that the weight in he had a cannot throw the handle violently against the car Although the handle is fees and can be held in any desired position when the load is not being lifted or lowered, a light tension balance draws it, when under a load into a perpendicular position which prevents it from protruding parallel to the floor

#### Sterilization by Pressure

I N a recent bulletin of the West Virginia University Agricultural Experiment Station, Prof B H Hite and associates Professors N J Giddings and Charles E Professors N J Gliddings and Charles E Weakley, Jr., present the results of a very large amount of work on the Lefect of Pressure on Microorganisms together with the technique of high pressure experimenting in bacteriology. Sum marked bright the results are as follows No living thing has been found that

No living thing has been found that could not be destroyed by pressure Most bacteria, including those respons-ble for typhoid, tuberculosis and diph-theria, are killed in three minutes by a the for typitois, tubercutous and appearance of 78,000 and the present of 18,000 and the present of 18,000 and the time and present of 18,000 and the time and present of 18,000 and the time required to kill an organism at a number of widely different presents, the intermediate time-present establishment, the time required to kill an organism at a number of widely different presents, the considerable accuracy Sports required much there seems to much longer time under the present sport forming organisms in the vegetative stage are safely hilled, and resellated no may be accomplished by repeated brief applications of 78,000 pounds jest against lack.

The above applies to reconstanting and the present of 8,000 pounds jest against lack.

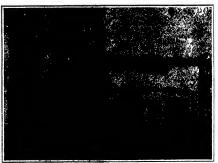

case of 74,600; pressure.

The above spaging to twom interpersure. Working at somewhat higher experiences in world be expected that over pressures would be affective, and his for the little securities of the control ne for I degions or reactionity the same.

The metercrite de an indeer tractor

pour is at the close of the day work and to find everything at rile and ready for work the next morning

work th next marning
Wor ing at 46 degrees C a pressure
of 75 000 t 100 0)) pounds per square
inch must be released or any water in
the only ressed material will be converted into a mass of soft ice. On releasing a priss of 200 000 nounds at leasing a press of 200 to pointon as or frozen hard Most other liquids attract or freezing so frozen at higher temperatures when pressure is applied (omparatively low pressure is apply d comparatively low pressures were found to be sufficient to freeze many liquids and the use of high pressure in obtaining low temperatures is suggested bolid chloroform melting at 70 degrees C was easily prepared

The high pressure equipment used by Professor lite and his associates is very simple and easy to construct. A high pressure cylinder may consist of a block of steel with a hole through it the hole leng closed at either end by steel plugs leng closed at either end by steet plugs on of win h is img en night to serve as a past in The linuid to be compressed as completely encased in a lead (or other soft metal) par ing which consists of a p see of lead tubing both ends of which are closed with lead lids. The pressure a samelled to the nacking and its conteptis is applied to the packing and its contents sa applied to the packing and its contents. There are no leaks the pressures ob-tamable are limited only by the strength of the cylinder and piston (yinders litended for very light pressures were built up of several concentric cylinders arunk together and thoroughly stretched by applying higher pressures than were to be requiarly used.

the picture shows one of the high pressure eviluders set up in an Olsen testing macline The inside diameter of this c linder is 0 632 inch A 16on this c inner is 0002 incn A 10-med sun built on the same proportions would be more than 1 i feet across the breech Incidentally the puton is sup-porting a load of 52 tons. The puton is supported by a column of water The cylinder had been used many times at higher progress. But his test was at higher pressures But this test was made and the picture taken by some doubting engineers who were satisfied with 300 000 pounds per square inch

#### The Motorcycle in the Factory

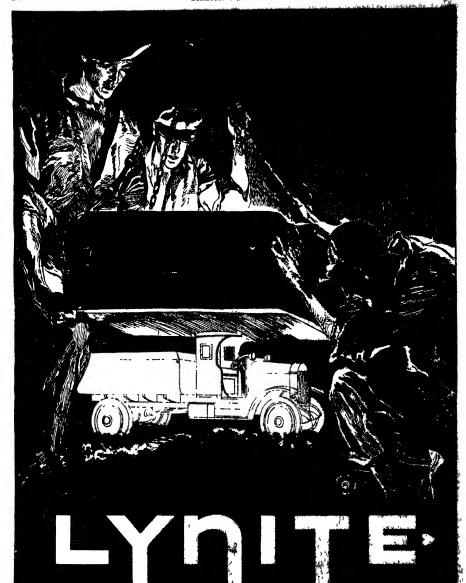

THL motorcycle is here seen in a flawarian pineapple cannery, used as a heavy hauling unit or baby tractor. The gearing is in the ratio of 26 to 1 in low gear 16 to 1 in intermediate gear and 10½ to 1 in high gear.

The hauling capacity is four and half tous to a trainlead of four cars each It tous to a training of four cars each It is figured that the pines are moved from the cooling floor to the warehouse a distance of one-fifth of a mile at the rate of two and one-half cents a ton machines are in use at the cannery, hauling from ten to eighteen cases of pineapples a day

#### Latest Patent Decisions

THE two patents here involved concern the construction of a tin cap, at the top of a yearly calendar pad, which by engagement with all in a permanent

engagement with alt in a permanent bactboard holds such pad in engagement with the bactboard. The court below found the patents valid and infringed. The ease turns on validity, and the court adds nothing to the reported case by a further discussion of detail. The question of inventive character of plaintaff s tin cap was one of fact A per-manent, slotted back, on which a new (Communed on page 701)

# Remolding the Motor Truck

Part by part piece by piece, Lynite foundries are remolding motor truck and motor car to new standards of liveliness and ease of handling, of gasoline and tire-saving.

Part by part, piece by piece, pounds or ounces are being cut from costly excess weight-pounds from the bigger parts such as cylinder blocks ounces from the smaller ones such as hub-caps and pedal plates.

For the automobile industry has found that no casting on a motor truck or motor car is too big to be made of Lynite, no piece too small to be worth making lighter through its use

Yesterday automobile dealers looked dublously upon efforts to make of Lynite a few such parts as crank-cases

Today more than seventy different car and truck parts are made of it one car alone containing 48 different pieces

And to the automobile world today Lynite no longer means those parts pre senting comparatively simple metal lurgical and foundry problems

It means the whole external structure of the engine-from cylinder head to oil pan It means the heart of the engine -the pistons It means entire bodies It means in a word practically every part for which heavy cast iron was once the accepted metal and still others that were formerly of steel brass wood or other material.

Lynite today is reducing the weight of motor cars from 300 to 500 pounds-not alone by getting rid of scores at one sweep from the larger parts but by trimming off an ounce or two here

an ounce there from a multitude of smaller ones

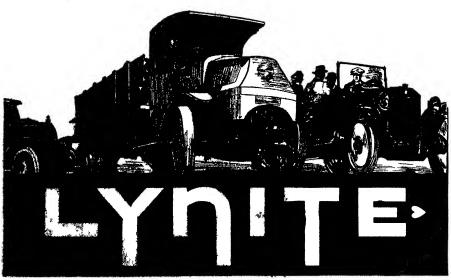

What is the explanation of this prog ress? For this you must look not alone to the tremendous strides which Lynite Laboratories and Lynute Foundries have been making-and are still making in extending the use of Lynste to more and more applications in the truck or car You must look as well to the readiness of motor truck and motor car builders to meet the ever increasing public demand for weight economy and all that it means

Together they presage the coming of that day in the not distant future when the truck or car with a cast iron part will be as out of date as is the one of today without electric lights

Copyr gh 1919 by The Goodyear Tire & Hutber C

POR rural motor expressing and general country hauling, we are convinced it is more economical and profitable to use Goodyear Pneumatic Cord Truck Tires—instead of solid tires. On solids, we have lost time, paid out losses in breakages and had to refuse business. Our Goodyear Cords paid for themselves in three months in business increases alone The rest has been sheer veloet "— Mr Jack Ginocchio, part owner of the Gardnerville Freight Line, Reno, Nevada

THIS rural motor express saves one day out of every three by using Goodyear Pneumatic Cord Truck Tires

A truck on these tires now completes a regular 104-mile mountain run daily, whereas a solid-tired truck covers it only twice in three days

The Goodyear Cords also cushion loads of farm products formerly damaged by the jarring on solid tires, and they reduce operating expense

A galion of gasoline lasts 11 miles on the pneumatics and 6½ miles on the solids

A quart of  $\alpha_1$  is consumed in 21 miles on the pneumatics and in  $17^{\tau_3}$  miles on the solids

On top of these savings the powerful Goodyear Cords are promising to rival or even surpriss the mileage delivered by solid tires in the same service

The experien e related, however, offers only one instance out of many in which the pioneer Goodwar Pneumatic Cor i Truck Tires have demonstrated their all around advantages for exacting hauling duty

# Introducing Williams' "Agrippa" Turning-Tool Holders Set Screw Pattern

To provide increased and abundant variety of selec-tion in Wilhams "Agrippa" line of Tool Holders, we offer this Set Screw pattern of Turning Tools pri-marily for those who use Cutters made of steel which marily for those who use Cutters made of steet which has been hammered or rolled with a greater variation in size than is common to usual mill practice. But for the majority of users who purchase Cutters of accurate size, we recommend the original "Agrippa" Turining Tool of Cam Pattern as being stronger, more reliable and more selectedly satisfactory than any other method

and more generally and offset and Straight Styles in Right and Left Hand Offset and Straight Styles in stock at same price as Cum Pattern of corresponding size Write for a copy of our Machinists Tools Booklet.

#### Thirty Million Years Ago (Continued from page 656)

The Burgess fauna of Walcott shows that The Durgous fanns of Walcott shows that he pre-Cambrian investories invested all water areas and because completely adapted to all life sonce of the sas, except possibly the abyese. The varied orders of the sass we know today were there. The orders that last the seas for lead are were there. But the main question are were there. But the main question of these great invertebrate divisions was it that says near to vertebrate it that says near to vertebrates. it that gave rue to vertebrates?

of these great invertebrate divisions was it that gave nate to vertebrates? Palsousle Epoch next above the Cambrane, is the period of the first vertebrates known Walott found near Canon City, Colo., that is set in the first the set of the period of the prevent Bighorn Mountains of the derivent Bighorn Mountains of the period of the prevent Bighorn Mountains of the period of the prevent Bighorn Mountains of South Dak. ta, small spines referred to sharks also shundant at Canon City. Sance they were slow moving types protected with the beginnings of a doreal armiture composed of small caleargues tubercia to which the group name Offers where the state of the period of t armored Ordovician cetracoderms, very httle is known. It is in the later Upper shows is known it is in the later Upper Silurian that we obtain our first glimpses of North American land life in the scorpion spiders the oldest known air-breathing animals and also of the first known land

Thus Walcott must be credited with having set up the whole panorama of first life on earth with actual fossil specimens of the creatures from which later insects, the pro-fish then true fish, then reptiles, then livis and then mammals and man

arose Oshorn's investigation of the first ap-

construction of the first appearance of plant life on earth carries back consuct rably before the above sentioned animal forms awe light. He states these of the periodic properties of the very animal limbestomes back of the very animal limbestomes the collection of the very animal limbestomes that the collections bacteria, developed the innever limestones of the Belt mountains of Ministan we are now beginning to see where the magness of the Belt mountains of Ministan we are now beginning to see where the magness of the hierarchy the most where the magness of the hierarchy the most limpertant contribution of that constituent for merchant marine.

The Grenville series of rocks at the base of the Palaconous secontially calcareous with a thickness of ever 94,000 feet nearly eighteen miles, more than half of which is calcareous, according to Pirmor and Schuchert Thus it appears probable and stationer raus it appears probable that the primordial surface continental waters swarmed with these minute sigae, which served as food for the floating. Protoson one-celled animal forms."

## British Textile Industries as Affected by the War (Continued from page 684)

possible if unrestricted sympathics by agents of all the Alliest governments had

den permitted been permutted. Whatever goods were purchased for the states gathers although the process and on the same conditions as for five error at the Brush government, and although "Arthurs," the Brush government, and although "Arthurs," arthurs, and the prices are the Brush government, and although "Arthurs," "Art stretch the freedom of the British manufacturer it has had important results in gitting the best out of the industrial organization of the consistery The tead-ency to concentrate in one hand the larging for the Allies from 'British Industries' sides from the stagle industries' has become more pronounced from year to year, owing to the ever increasing extingency of all sensitial ray materials, in contraction, with the presence on machinery and 'Babus,' has had an important ramp's. It was

the several British discrete and Allied tectors for critical goods we cause of a disproprishence discrete machinery and tracted. Where it requirements came too sloin as in run output, the retarded product and it impossible to province at its impossible to province at a second control of the muin output, this retarded professions and made it impossible to poisest all that their recaired Complete seasons all that their recaired Complete seasons their content in the seasons in the content impossible or realization, but long steps have been tables to limit the variety demanded. In purtuance of the content setting the content in the season of the content setting the content in the profession of the content setting the content in the woolen industry, where the changes in the woolen industry, where the changes in the woolen industry, where the changes application to the orders of Allied geverances of the British requisition system of purchase, and the issuance, against timb orders, of materials from the common stock,

purcease, and use measures, against some activity.

The system of purit purchase has also been extended to certain raw materials obtained from abreed Supplies of just and just goods for the Alless have for some times are been bought under the arrangement of the control of the

extremely rapid in comparison with the rate at which seas usually destroy their coasts. This high rate of destruction is coasts. This high rate of destruction is accounted for by the kind of material washed away and its low power of resistance when attacked by waves Compare the work of the lakes #aves north of Chicago with that of the Atlantic Ocean at Gloucester Mass or of the Pantic Ocean at Cypress Pediat Coll. The Lite has material mills show The lake has penetrated miles into the land while the oceans have progressed only rods in the same time but the sea have worn away cliffs of hard solid rock have worn away cliffs of hard solid reck a foot a century perhaps while the lake, has encountered only loose soil. One sight watch the Atlantace aware posnicing for months et. Gloucester and never use a front of the sight was a foot of the sight with the sight of t

in the district under consideration. The soil consists of clay sand gravel and brulders all deposited by ice during the Clacial Age Most of it was brought down from the north on moving ice floating on from the north on moving ice floating on water or pushed forward over the lan! Part of it undoubtedly same from Chanda several hundred miles distant from its place of deposit but other was stooped up as the moving ice crossed Wiscoman as may be learned from an esamination of the material. The les sheet was kundreds or perhaps thousands of feet thick and was ladden with earth and stones. or perhaps thousands of feet thick and was laden with earth and stones it progressed little farther southward than the southorn and of lake Michigan There, it mitsed during many conturies and its load of earthy material was dropped forming a layer from 100 to 200 feet their. That transportou material is now the land and the soil of the region and it con-tinuously the soil of the soil of the con-tinuously than the soil of the region and it con-tinuously the soil of the region and it con-tinuously thanks and the soil of the region and it constriutes the banks and bluffs which the waves are now b sting down and washing away Steadily during thousands of years

wave are not over acquired to the same area. Stoodly during shousands of years the wave hard been accounted to the same acquired to the same active during so long a period as continuing with such rapidity under the very eye of the observer that he may conceime so the same active during so long a period as continuing with such rapidity under the very eye of the observer that he may conceimes so the observer that he may conceime so the source of the observer that he may conceime so the between the at-from the three same acquired to the same acquired t

Sheer muscle power is not enough. In the average warehouse more than mere number of men is needed. For though guant of stature, they cannot reach the high points And so space is wasted

Economy Storage Engineers how ever have devised a truly econom ical system that overcomes this fault It enables one man to do work that would tax the strength of three or more With this system one man can reach points too high for an en tire crew He can lift as much as two thousand pounds to the very ceiling and then single handed push the package into place

Seventeen years ago the idea was born But limited facilities for the production of equipment kept many progressive concerns from enjoying the benefits of this the Economy System of Storage Handling

Today however with a modern plant of greater capacity we are ready to serve all—ready to plan the most efficient application of the Economy System to your own individual needs to make your ware housemen more efficient and your space less expensive

Hundreds of successful concerns owe their storage efficiency to the Economy System For specific details as to what it will save for you and how write our Chicago office Doing so does not imply your intent to purchase.

material and planing is within reach of the waves which specifity earry it sway Wingwale and breakwester have been the property of the property of the to check this destruction. Some of them are built by private parties to protect their lands which front on the lake; others are the work of eiths, companies, associations, and municipalities for a similar purpose. The lake shere porth-used from Chicago heavy, or and and and invasionally and the property of the pro-tection of the property of the pro-try of the property of the pro-try of the property of the pro-try o Milwaukee is covered with magnificents private estates, club houses and grounds, golf courses, schools, manufacturing plants, hospitals orphanages, towns by the doses, government property, including Fort Shendan and the Naval Training Statuon at North Chicago

Sheridan and the Navai I running present at North Chicago

The continued advance of the lake into the land is destroying or imperiling much of thus valuable property. In consideration of that fact the lake a scirvities cannot be that fact the lake a scirvities cannot be a second little or not of that fact the lake a scravites cannot be viewed lightly it mattered little or not at all in the long ago when the only human inhabitants of the shore were the savage Indians who could easily move their camps farther back when the caving camps farther back when the caving banks threstened to precipitate them into the lake The millionaire who owns the land now cannot move back as the waves approach, and he builds breakwaters to protect his property Calculations which make what seem to he resonable allowance for uncertainties concerning the average dont of the land

be reasonable allowance for uncertainties concerning the average doubt of the land which has been washed away by the lake during the past four or five thousand years show a yearly average of 7,000,000 tons of soil that has gone into the lake and disappeared from the 150 miles of shore north of Chargo. The 600 square nuise of land would equal a cube 12,000 (est on the side of land would equal a cube 12,000 (est on the side of land would equal a cube 12,000 (est on the side of land would equal as the beauty of the side of land would equal as the side of land would equal a cube 12,000 (est on the side of land would equal as the side of land would expect the side of land would or and would equal a cuts I and how to come the side amounting to several cubor miles the annual toll of 7,000,000 tone is an anormous quantity to sink from eight boneath the water every year, and its final destination excites interest fix hundred square miles of land are not easily hidden square miles of land are not easily hidden Must of the burden a soft, extramely fine material that was ground to rock powder by glosers in their slow journey from the north long ago. But maced with this finely ground material are occasional streaks of gravel rocks and large boulders which were dropped when the set that carried them was noticed. These may be seen protecting from the less of this bluff grow to the set of the butter of the set of the seen protecting from the less of the bluff or the set of along the water front. As the hand wears away the boulders rell into the lake where they rest because the currents are not strong enough to move them A few large boulders lie strewn over the country where they were evidently dropped from leobarge floating over when the respon was covered by water One such boulder, weighing probably 100 000 pounds, lies must het was the street of the lake betten off shore and such are partecularly numerous of the town of Winnesta, where they mark the position and direction of a former glacial moraine which the lake had destroyed by its encreachment. The remaining sith of the moraise forms the lake builf at Winnesta, and the activesse end of the such as the lake builf at Winnesta, and the activesse of the lake in the lake had a control to the moraise forms the lake such as the coupled by the samelegal conditions of the such as the same of the lake in the lake along the water front As the hand wears away the boulders roll into the lake where

has carried the sand and dust valued, some of it many mine frox the present sheer. The sand hills, durse, and ridges which form so conspacous a part of the landseeps between Gary, Indiana, and Minhigan City, and beyond, are build of this material. Some of the hills are from 100 to 300 feet high, and mile in status. The finely-powdered mad is driven before the wind in auch quantities as to bury forces in eight.

#### Ameteurs in Name Only

while some apparetus of the inexpending category is now bring made, for the most part the manifestiment have gene on to what is gractically commercial equipment. Where an instrument used to core three dollars, it now costs ten where a complete recovering set used to cost \$20, in new costs \$100. But there us as much difference between these cots as between the cost as between a "ene how shy" and a powerful autoenchile.

#### Wherein Nothing but the Best Will De

Nothing serves better to illustrate the type of instruments and sets now being produced for and purchased by the ame-teur, than some of the accompanying illus-trations. The mechanical and electrical trations. The mechanical and electrical improvements that have been carried out are wrident at a glance to those familiar with pre-war equipment. No longer is wood acceptable for mounting the metal parts and familiar, and even hard rubber with standing disquees and indicators will not pass messer with the critical annature land the same of the materiments must be of beachts with the lettring and must be of beachts with the lettring and the standing of the metal parts are finished in black coydised brase and white nicked The knobs are large and carry and lett in the latter which in the latter which is the same of the same parts are finished in black coydised brase and white nicked The knobs are large and carry nnined in blace oxyclased brass and white nickel. The knobs are large and earry dials which turn past a marker, instead of the old practice of carrying an indicator on the knob and fastening the dial to the

panel
Simplicity in design and operating controi is the object of the designers of the new
amateur apparatus, sithough the circuits
employed and the methods are by no means

anateur apparetus, although the erroulis employed and the methods are by no means elementary, involving the very latest commercial practice. While manufacing the very best appearance the present apparatus receives the name care with expression of the interior details, as a review of the interior of the interior details, as a review of the interior of the interior of details, as a review of the interior, in constitution of the interior of t

measuring and weighing devices of the state and in use in the state

e Standard Company manufactures combination spring and lever computing scale which was then being used and sold in New York It is equipped with a compensating device which is not auto matic Because of these specifications some county and city scalers of weights neglected to seal scales of plaintiff s make and warned scale users to discontinue the and warned scale users to discontinue the use thereof. A state inspector who was a subordinate of the state superintendent also marked some of these scales, slow and faulty. As a result the Standard Com s business in New York was injured sales diminished and collections for scales theretofore sold became difficult. The Standard Company contends that its scales with a mechanical compensating device are at least as trustworthy as those of its competitor with the automatic device and it presented these views to State Superintendent Farrell both before the sponifications were issued and there

Held that so called specifications to automatic computing scales are not a regulation of law within the prohibition of the Lederal Constitution as to state on one rearral Constitution as to state legislation their function being oducational and at most advisory. Stantist Computing Scale (c. v. Farrell. Supreme Court of United States.

The plaintiff in this bill in equity charged infringement of re-useue latters patent for an improvement in box strapping invented by Leon S Howe The bill further charged unfair competition. The District Judge sustained the patent held that there was infringement and dismissed the charge of unfair competition. The defendant denied that there was invention or infringement but says that the patent | They may occur singly or two may be in suit is invalid because it claims not a heard in rapid succession and more fre patentable combination but a mere ag gregation of old clements. It further claims that the reassue patent is invalid

claims that the re-issue patent is invalid the Yandott hills known as the Stony.

Box strapping used by maintier uners, the strapping used by maintier uners, the strapping used by maintier uners, the strapping used by maintier under the united strap words and the strapping used by maintier under the united strap words and the strapping used to have been sufficient to the strapping are nailed around cach and the strapping used to have been sufficient to the strapping used to hav partially the case as a fast interior the intended goodpeen important the parallal shape to be parallal shaped the parallal shaped dawn a branch of the pushed and hauled over and all soft the case as a fast that flowed dawn a branch of the case and hauled over and all soft the case and all shaped the case and all shaped the case and t pushed and fished over and at yet the cream culty freek and remnants of the floors of warehouses ratinoid care or on flow exists as actions of low hills. These the decks of ships it is essential that the terminal control of the strapping and the mails the remnant of the transping and the mails the strapping and the mails that the control of the strapping and protected as to avoid their catching the though and protected as to avoid their catching the three described by the residents of the intention and thus prevent the strapping the strapping and the strapping the strapping and the in the floor and thus prevent the strapping

#### Germany's Aircraft Experimental Station

A MONG the places visited by the Allied Naval Commission in German waters was Warramonaton in terman water was Warramonde the great experi mental station on the south coast of the probable that they are The bearings the Commission visited the station there a part of the parab through which there were close on 200 machines in the dosen or more sheds practically all of them of new types or old ones in process of im ent The latter included some very useful looking Brandenburgs, Albatrosses Frederichshafens and Gothas, most of which seemed to indicate an effort toward lightness and speed rather than an increase of size Light but very strong steel pontoons were the rule among all of these pontons were the rule among at of these new machines Generally speaking they were less highly finished than similar British and French types but there was no indication whatever that they had suffered istratas and i reach types but there was no i Smeaton filli or Mount Acoroccheang, an undecation whetever that they had suffered extinct volcano where faults are known through shortage of any materials. Alu-About ten miles south of the piaco where minum—or where greates strength was the supposed broudid semante, three an object the alloy, duralumm—were extant volcanoes, Eastern Hill Mount used lavably, and even bras and nickel Prospect and Langdon still includes a line were not stumped. The camouffaging of fracture of the earth scruh. If this line had been very chassity and effectively done be proposed northward, it would pass by printing a design—usualty a heangonal close to where the sounds originate.

pattern in which deep marcons and indigos predominated—directly upon the fabrics before applying the dope
A powerful two-engined Gotha torped >-

dropping scaplane attracted a good deal of interest less on its own account than because it was experted that the Germani would have a voly much hat derive that it development of the type. Of very land types continues Arronaulus there were several as he of Iravenumdes 8 V K S. and Sablatings in in if them large but all in their trum lines and powerful engines showing the cenation office to development where the continues of the co would have given much attention to th ever was a giant scaplane with four engines and with a wing spread of some thing like 150 feet I hough this was greater than that of the great monoplane at Nordeny it is not improbable that the latter had a greater wing area and perhaps a greater lifting power. No better idea of the size of the fuselage of this scaplant could be given than by mentioning that in the courts of inspection four of the Allied facers and 12 of the Germans were standing on the floor the writer could eatch no glimpse of one of them

#### Subterranean Noises in Australia

Solution resembling expications which could not be traced to any mining or quarrying operation are heard at intervals in the Daylesford district of Victoria says the Australian Geological Survey The sounds are described as resembling thunder or the explosions made in blasting rocks quently in wet than in fine weather. The noises are said to come from a portion of the Yandoit hills known as the Stony

other countries and are generally known as bronted (like thunder) in India they are known as barisal (guns), in Mexico as bramidos (bellowings) in Italy as marine

es shore)
It is not certain that the Yandort noise apparently passes a line of weakness the surface indications of which are a series of surface indications of which are a series of mineral springs and on the southern extension of this line is a line of fissure cruption. It is possible that the noises originate along a fault line that move ments are yet taking place, and that the

There is another possible explanation in that the locality where the sounds are heard is volcanic since the part indicated by the bearings is within five miles of Smeaton Hill or Mount hooroochesng, an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Clark Internal Gear Axle is to a motor truck what a full floating axle is to a passenger car.

> Clark Disc Steel Wheels for motor trucks not only look stronger but are stronger.

> > Clark Equipment is found only on good motor trucks
